for first-time users of this powerful technique. Novel applications in protein biochemistry, genomics, biotechnology and biomedicine made possible by the expansion of the genetic code are discussed and numerous examples are given. Essential reading for all molecular life scientists who want to stay ahead in their research.

This book discusses the fundamentals of molecular simulation, starting with the basics of statistical mechanics and providing introductions to Monte Carlo and molecular dynamics simulation techniques. It also offers an overview of force-field models for molecular simulations and their parameterization, with a discussion of specific aspects. The book then summarizes the available know-how for analyzing molecular simulation outputs to derive information on

thermophysical and structural properties.

Both the force-field modeling and the analysis of simulation outputs are illustrated by various examples.

Simulation studies on recently introduced HFO compounds as working fluids for different technical applications demonstrate the value of molecular simulations in providing predictions for poorly understood compounds and gaining a molecular-level understanding of their properties. This book will prove a valuable resource to researchers and students alike.

Computer Simulation in Chemical Physics contains the proceedings of a NATO Advanced Study Institute held at CORISA, Alghero, Sardinia, in September 1992. In the five years that have elapsed since the field was last summarized there have been a number of remarkable advances which have significantly expanded the scope of the methods. Good examples are the Car--Parrinello method, which allows the study of materials with itinerant electrons; the Gibbs technique for the direct simulation of liquid--vapor phase equilibria; the transfer of scaling

The field has also been stimulated by an enormous increase in available computing power and the provision of new software. All these exciting developments, an more, are discussed in an accessible way here, making the book indispensable reading for graduate students and research scientists in both academic and industrial settings.

economic problem to humans. Organized into 10 chapters, this book starts with an overview of the problem of air pollution, particularly photochemical smog. This text then discusses the factors that collectively determine the amount and spectral distribution of the radiation entering a surface layer of the atmosphere. Other chapters compare the specific absorption rates of several absorbers that are present in the air during periods of photochemical smog, including oxygen, ozone, nitrogen dioxide, sulfur dioxide, ketones, peroxides, and particulate matter. The final chapter deals with the process of formation of the substances responsible for the physiological effects of eye irritation and plant damage. This book is a valuable resource for photochemists and air pollution scientists.
