In Part I brief particulars of the accident, the crew and the aircraft are set out. The establishment of the Board of Inquiry and the procedure followed by it are detailed. In Part II the factual circumstances of the accident are detailed. Part III looks at the contributory causes of the accident (human factors and error, corporate deficiencies, the implications of a metric aircraft in a non-metric fleet, equipment factors). In Part IV summaries of evidence from other airlines in Canada, the U.S. and Europe is given. Part V sets out aviation safety recommendations, particularly regarding the metric question on fuelling procedures, equipment improvement, improvements to the Minimum Equipment List, corporate structures and training.

Most aviation accidents are attributed to human error, pilot error especially. Human error also greatly effects productivity and profitability. In his overview of this collection of papers, the editor points out that these facts are often misinterpreted as evidence of deficiency on the part of operators involved in accidents. Human factors research reveals a more accurate and useful perspective: The errors made by skilled human operators - such as pilots, controllers, and mechanics - are not root causes but symptoms

of the way industry operates. The papers selected for this volume have strongly influenced modern thinking about why skilled experts make errors and how to make aviation error resilient.

Every day in the United States, over two million men, women, and children step onto an aircraft and place their lives in the hands of strangers. As anyone who has ever flown knows, modern flight offers unparalleled advantages in travel and freedom, but it also comes with grave responsibility and risk. For the first time in its history, the Federal Aviation Administration has put together a set of easy-to-understand guidelines and principles that will help pilots of any skill level minimize risk and maximize safety while in the air. The Risk Management Handbook offers full-color diagrams and illustrations to help students and pilots visualize the science of flight, while providing straightforward information on decision-making and the risk-management process.

The aircraft dispatcher is critical to air travel safety and a viable

career option for many aviators. With this book, prepare for the FAA oral and practical exam to earn the Aircraft Dispatcher certificate.

Human error is implicated in nearly all aviation accidents, yet most investigation and prevention programs are not designed around any theoretical framework of human error. Appropriate for all levels of expertise, the book provides the knowledge and tools required to conduct a human error analysis of accidents, regardless of operational setting (i.e. military, commercial, or general aviation). The book contains a complete description of the Human Factors Analysis and Classification System (HFACS), which incorporates James Reason's model of latent and active failures as a foundation. Widely disseminated among military and civilian organizations, HFACS encompasses all aspects of human error, including the conditions of operators and elements of supervisory and organizational failure. It attracts a very broad readership. Specifically, the book serves as the main textbook for a course in aviation accident investigation taught by one of the authors at the University of Illinois. This book will also be used in courses designed for military safety officers and flight surgeons in the U.S. Navy, Army and the Canadian Defense Force, who currently utilize the HFACS system during aviation accident investigations. Additionally, the book has been incorporated

into the popular workshop on accident analysis and prevention provided by the authors at several professional conferences worldwide. The book is also targeted for students attending Embry-Riddle Aeronautical University which has satellite campuses throughout the world and offers a course in human factors accident investigation for many of its majors. In addition, the book will be incorporated into courses offered by Transportation Safety International and the Southern California Safety Institute. Finally, this book serves as an excellent reference guide for many safety professionals and investigators already in the field.

This book examines how government, industry and society interact to reach a level of regulation that is deemed satisfactory for the newly-emerged transformative technology that is agricultural biotechnology. It considers issues of risk and trust surrounding genetically-modified plants for the production of food and pharmaceuticals. It describes how regulations have been produced to manage, or in some cases ignore, the risks from GM products. The scope is international and the book makes a significant contribution to the literature in this growing field of interest.
