There are four properties involving multiplication that will help make problems easier to solve. They are the commutative, associative, multiplicative identity and distributive properties. Commutative property: When two numbers are multiplied together, the product is the same regardless of the order of the multiplicands. For example 4 * 2 = 2 * 4

Zero-product property. For example, if x(x + 2) = 0, then x = 0 or x + 2 = 0. If you’re trying to perform an operation that isn’t on the previous list, then the operation probably isn’t correct. After all, algebra has been around since 1600 BC, and if a property exists, someone has probably already discovered it.

The Distributive Property is easy to remember, if you recall that "multiplication distributes over addition". Formally, they write this property as "a(b + c) = ab + ac".In numbers, this means, for example, that 2(3 + 4) = 2×3 + 2×4.Any time they refer in a problem to using the Distributive Property, they want you to take something through the parentheses (or factor something out); any time a ...

Later, students will see 7 × 8 equals the well remembered 7 × 5 + 7 × 3, in preparation for learning about the distributive property. In the expression x 2 + 9x + 14, older students can see the 14 as 2 × 7 and the 9 as 2 + 7. They recognize the significance of an existing line in a geometric figure and can use the strategy of drawing an ...

I. Commutative Property. For Addition. The sum of two or more real numbers is always the same regardless of the order in which they are added. In other words, real numbers can be added in any order because the sum remains the same. Examples: a) a + b = b + a. b) 5 + 7 = 7 + 5. c) {}^ - 4 + 3 = 3 + {}^ - 4. d) 1 + 2 + 3 = 3 + 2 + 1
