With the transmission line clearly defined as a circuit element, it can now be analyzed when a load is attached. We define the load to be located at $z=0$ to simplify the analysis. The current and voltage at the load can be related by the load impedance. Using equations 10 & 15,

Transmission Lines - Basic Theories

The transmission line system is a "direct radiator" alignment that is designed to use the $1/4$ wave resonances in a waveguide to enhance and extend its useful range of operation. The waveguide reverses the phase of the driver's rear output

by the time it reaches the terminus, thereby reinforcing the output near the lowest resonance frequency of the waveguide.

A transmission line is also an electrical network, and hence the transmission line can be represented

as a two-port network. Hence two-port network of the transmission line can be represented as 2 by 2 matrix. Here the concept of ABCD parameters comes into play. Voltage and currents of the network can be represented as:
