Part VII. Anchor Bolt Chairs hen anchor bolts are required at supports for a shell, chairs are necessary to. distribute the load to the shell. Small tubular columns (less than 4 ft in diameler) may be an exception if the base plate is adequate to resist bending. Otherwise, chairs are always needed to minimize secondary bending in the shell. For flat-bottom tanks, choose a bolt circle to just ...

Anchor bolt chairs are structural attachments used to control the overturning stability of aboveground storage tanks subjected to external and internal forces. Throughout this investigation three different design procedures were evaluated in order to determine the localized stresses occurring in the shell above the chairs due to wind load.

A practical handbook, this second edition of a successful guide will prove itself valuable on a daily basis with its reliable and up to date facts and figures. The intent is to increase the reader's design efficiency with numerous design shortcuts, derivations of established design procedures, and new design techniques. Time-saving formulas, calculations, examples, and solutions to design problems appear throughout.

The most unique application of neutron diffraction is in the study of the scattering phenomena due to interaction between the neutron magnetic moment and the magnetic moment of the atom, since neither X-ray nor electron diffraction can furnish information regarding the electronic spin structure. Crystal structure analysis is frequently a necessary preliminary to the magnetic study. Because of the scattering-amplitude characteristics, the neutron-diffraction technique has often

played more than just a complementary role to X-ray and electron methods.

This updated version of the first edition examines the strength and deformation behaviour of riveted and bolted structural connectors and the joints in which they are used.
