Anatomy of the Urinary System. The urinary system consists of two kidneys, two ureters, a urinary bladder, and a urethra. The kidneys alone perform the functions just described and manufacture urine in the process, while the other organs of the urinary system provide temporary storage reservoirs for urine or serve as transportation channels to carry it from one body region to another.

Anatomy of the Urinary System | Johns Hopkins Medicine
The urinary system consists of the kidneys, ureters, bladder, and the urethra. The kidney consists of millions of functional units called nephrons. The urinary system removes wastes from the body and regulates blood volume and blood pressure. It also controls the levels of electrolytes and metabolites in body fluids and regulates blood pH.

Urinary System - Anatomy & Physiology
Anatomy and Physiology – The Urinary System Humans have the capacity to excrete toxins. For instance, the urinary system is major excretory system of the body. It helps in homeostasis specifically in electrolyte balance, fluid balance and acid-base balance.

Urinary System Anatomy And Physiology - RNspeak.com
The urinary system consists of the kidneys, ureters, urinary bladder, and urethra. The kidneys filter the blood to remove wastes and produce urine. The ureters, urinary bladder, and urethra together form the urinary tract, which acts as a plumbing system to drain urine from the kidneys, store it, and then release it during urination.

Anatomy of a glomerulus -- From the afferent arteriole, blood flows into the glomerulus, which is a series of specialized capillary loops. It through these capillaries that water and small particles are filtered from the blood to make urine. The remaining blood leaves the glomerulus through the efferent arteriole.
