Anticonvulsants or antiepileptic drugs (AEDs) are used to stop an ongoing seizure or to decrease the frequency or severity of anticipated future seizures. During a seizure episode or status epilepticus, the route of administration for AEDs is IV (see Table: Drugs Used for Treatment of Status Epilepticus).

**Anticonvulsants or Antiepileptic Drugs—Pharmacology—??**

Anticonvulsants (also commonly known as antiepileptic drugs or as antiseizure drugs) are a diverse group of pharmacological agents used in the treatment of epileptic seizures. Anticonvulsants are also increasingly being used in the treatment of bipolar disorder and borderline personality disorder, since many seem to act as mood stabilizers, and for the treatment of neuropathic pain.

Antiepileptic medications do not alter the underlying problem predisposing to seizures. People with epilepsy are prescribed antiepileptic medications with the aim of decreasing the number, severity, and/or duration of seizures. While seizure freedom is the ideal outcome of treatment, seizures can still occur while taking antiepileptic medication.
