A given trait must be defined only by the alleles we're going to use in the genetic square. The blood type inheritance makes a good example of a trait that is perfect to use in the Punnett square calculator. The height of a child cannot be predicted using the Punnett square method - there are too many variables and genes affecting this trait.

Each square in the Punnett square represents a blood type that the baby could have. Within each square, write the allele from the mother and the allele from the father that correspond to the row and column of that square. For example, you would fill in the first square with the “A” allele from the father and the “A” allele from the mother.
