Sikh Art and Literature traverses the 500-year history of a religion that dawned with the modern age in a land that was a thoroughfare of invading armies, ideas and religions and arts of the East and West. Essays by art curators, historians and collectors and religion and literary scholars are illustrated with some of the earliest and finest Sikh paintings. Sikh modernism and mysticism is explored in essays on the holy Guru Granth Sahib; the translations and writings of the British Raj convert, M.A. Macauliffe; the fathers of modern Punjabi literature, Bhai Vir Singh and Puran Singh; and the 20th century fiction writers Bhai Mohan Vaid Singh and Khushwant Singh. Excerpts from journals of visitors to the court of the diminutive and new translations of early twentieth century poetry add depth and originality to this beautiful and accessible introduction to the art, literature, beliefs and history of the Sikhs. Illustrated throughout with 42 colour and 92 black and white images, Sikh Art and Literature is a colourful, heartfelt, and informative introduction to the Sikh culture.

An overview of the methodologies and techniques of the emerging field of systems biology.

Epigenetic mechanisms (DNA modifications, histone alterations and non-coding RNAs) are crucial for transcriptional regulation and alterations of the "physiological epigenome" are increasingly associated with human diseases. During the last decade the emerging field of neuroepigenomics have started to impact tremendously in areas such learning and memory, addiction or neurodegeneration. This expert volume covers the role of epigenetic molecular mechanism in regulation of central nervous system's function, one of the most exciting areas of contemporary molecular neuroscience. The book describes the current knowledge on the epigenetic basis of human disease covering the complete lifespan: from neurodevelopment/childhood (Rett Syndrome, Rubinstein-Taybi, autism), adolescence (eating disorders, drug addiction, anxiety), adulthood (depression, schizophrenia, amyotrophic lateral sclerosis, Huntington's disease) and elderly (Alzheimer's disease, Parkinson's disease). The book also covers the three major players on neuroepigenomic mechanisms: histones alterations, DNA modifications and non-coding RNAs, their roles at the molecular and cellular level and the impact of their alterations on neuronal function and behavior. Finally, a special chapter on state-of-the-art technologies helps the reader not only to understand epigenetic driven changes in human cognition and diseases but also the methodology that will help to generate paradigm shifts on our understanding of brain function and the role of the neuroepigenome in human diseases.

This volume is a critical exposition of the data and analyses from a full decade of rigorous research into how age-related changes at the individual level, along with other factors, contribute to morbidity, disability and mortality risks at the broader population level. After summarizing the state of our knowledge in the field, individual chapters offer enlightening discussion on a range of key topics such as age trajectory analysis in select and general populations, incidence/age patterns of major chronic illnesses, and indices of cumulative deficits and their use in characterizing and understanding the detailed properties of individual aging. The book features comprehensive statistical analyses of unique longitudinal data sets including the unique resource of the Framingham Heart Study, with its more than 60 years of follow-up. Culminating in penetrating conclusions about the insights gained from the work involved, this book adds much to our understanding of the links between aging and human health.

Consists of facsimiles of pages from the transcript of the trial, from 30 August-1 October 1946.

In deciding which models to choose for inclusion in this book selected from Fiat's huge inventory, the author concentrated on three criteria - greatness, size and emotion. Where size is an easy parameter to qualify, greatness is more complicated because it is a combination of of both the manufacturer's and the public's opinion. A car that is highly regarded by the public may not have been a commercial success and vice versa. A truly great car is one that works well for both parties. Emotion may be considered to be an element of greatness in that the public's 'love' for a car is a fantastic benefit for a manufacturer and must be treasured. Fiat have made the mistake of 'improving' an icon on several occasions only to find that public opinion went against them. Fortunately Fiat has been magnanimous enough to respond by giving the car buying public more of what it wants. As long as they continue to do so then Fiat's reputation as the world's greatest small car manufacturer is set to continue. The author chose the Topolino as the starting point as the car fulfils all the criteria and it was the first Fiat built in the late 1930s to satisfy the Italian public's new-found desire for mobilisation. The old conventions of car production were turned upside down with the arrival of the 600 which revolutionised car production techniques and maximised on passenger space and performance at minimal cost. These principals continued via a succession of models which include the 500, 850, 126, 127 through to more recent models like the Cinquecento and Seicento. Running in parallel with these 'cheeky' Fiats, this book covers a range of slightly larger cars that were built in huge numbers. Though rather staid in appearance, the 1950s Millecento was family transport for millions of Italians covering three decades, four when the Indian-built cars are included. Similarly the 128, Panda and Uno were 'the' Italian small cars of the '70s, '80s and '90s. Nuova Panda carries the banner to the present day.

This book explores the nature of spirituality, its relationship to religion, and the reasons for its importance in clinical practice. Different chapters focus on the key subspecialties of psychiatry, including psychotherapy, child and adolescent psychiatry, intellectual disability psychiatry, substance misuse psychiatry and old age psychiatry.

Proper expression, folding, transport, and clearance of proteins is critical for cell function. Chaperones and enzymes that posttranslationally assist newly synthesized proteins help ensure that they fold correctly or are degraded. Translocation machineries, proteasomes, and autophagic activities help to localize and degrade proteins as necessary. Stress and aging can cause such mechanisms to become dysfunctional or overloaded, resulting in the accumulation and aggregation of misfolded proteins a feature of numerous neurodegenerative conditions. Written and edited by experts in the field, this collection from Cold Spring Harbor Perspectives in Biology covers the entire spectrum of protein homeostasis in healthy cells and the diseases that result when control of protein production, protein folding, and protein degradation goes awry. The contributors examine the physical biochemistry of protein folding and the roles of the various cellular compartments in protein quality control, as well as approaches for ameliorating protein misfolding and aggregation diseases. Including discussions of specific disorders such as Alzheimer's disease, Huntington's disease, and prion diseases, this book is an essential reference for not only molecular and cellular biologists but also medical scientists wishing to understand the pathological consequences of and potential therapies for protein homeostasis deficiencies in common human diseases.

In this book, researchers deeply involved in the development and improvement of chromatin immunoprecipitation assays (ChIP) provide cutting-edge protocols devoted to the most recent progress in ChIP and related subjects.
