Bone augmentation techniques using synthetic graft materials (i.e., alloplasts) have demonstrated potential in surgical therapy for >100 years. 172 Calcium sulfate and calcium phosphate compounds are attractive alternatives to autografts because of their biocompatibility, handling characteristics, porosity, different rates of dissolution, chemical and physical resemblance to bone mineral, and potentially unlimited supply at a modest cost. 173-177 Granular porous HA has been considered a ...

Conclusions: Many different techniques exist for effective bone augmentation. The approach is largely dependent on the extent of the defect and specific procedures to be performed for the implant reconstruction. It is most appropriate to use an evidenced-based approach when a treatment plan is being developed for bone augmentation cases.

Results: The techniques for reconstruction of bony defects that are reviewed in this paper include the use of particulate bone grafts and bone graft substitutes, barrier membranes for guided bone regeneration, autogenous and allogenic block grafts, and the application of distraction osteogenesis.

Bone Augmentation Techniques - Wiley Online Library

These include, but are not limited to, the use of barrier membranes for guided bone regeneration, particulate grafting materials, block grafting techniques, distraction osteogenesis, ridge split techniques, the current applications of growth factors to accelerate the rate of bone formation, and enhance the quality of bone formed especially in severe defects, and finally, to discuss the combination staged approach of these techniques. Key words. dental implants, guided bone regeneration, bone ...

Ernesto A. Lee, DMD, explains more about the clinical features of this new bone grafting technique. Traditional guided bone regeneration (GBR) techniques include flap mobilization and placement of a bone graft, often with the use of space-maintaining devices and cell occlusive membranes. This approach is frequently associated with complications, such as incomplete wound closure and soft-tissue dehiscence that may lead to exposure and infection of the membrane and graft material.

Bone Augmentation Techniques Journal Of Periodontology

Numerous ridge augmentation techniques are covered, including: horizontal and vertical guided bone regeneration, autologous block transplantation, interpositional bone grafting, allogeneic blocks, sandwich technique, split-expansion ridge technique, and sinus floor grafting.

The risk of bias of the included studies was assessed using EPOC criteria. Meta-analysis was performed using Review Manager for studies with quantitative data on mean values of vertical bone gain and bone resorption achieved with various bone augmentation techniques. Random effect model was used.

Vertical Ridge Gain with Various Bone Augmentation ...

Patients with insufficient natural, healthy bone to support dental implants could be ideal candidates for bone augmentation, which is the process of rebuilding the bone. The goal is to provide a sound structure where implants can be placed and secured in the alveolar bone structure. The augmentation is most commonly done by a bone graft, which is placing bone graft material to the existing bone in your jaw, which then adheres to it to form new bone, notes the Mayo Clinic.

Bone Augmentation And Nerve Repositioning

Within the alveolar ridge augmentation technique, different surgical approaches were identified and categorized, including guided bone regeneration (GBR), onlay/veneer grafting (OVG), combinations of onlay, veneer, interpositional inlay grafting (COG), distraction osteogenesis (DO), ridge splitting (RS), free and vascularized autografts for discontinuity defects (DD), mandibular interpositional grafting (MI), and socket preservation (SP).

In particular, the anorganic bovine bone (ABB) has received attention in the literature, since it yielded a long-term success in ridge augmentation technique. ABB has fundamental characteristics of biocompatibility and osteoconductivity and produces a good scaffold for new bone formation (19,20).

These include vertical augmentation by use of segmental osteotomy in conjunction with interpositional bone grafting, distraction osteogenesis, bone regeneration with titanium mesh or membrane, and autogenous onlay bone graft.13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24 The disadvantages of these techniques include multiple operations, unpredictable bone resorption, complications at the bone donor site, prolonged waiting period before implant insertion, lengthy rehabilitation period, and ...

A Novel Technique for Vertical Bone Augmentation in the ...

Another technique to place dental implants in the maxilla when Type III or Type IV bone is encountered is with the use of osteotomes.11-13 Summers introduced this technique whereby vertical and lateral expansion could be achieved in the maxilla with the use of sinus-elevation osteotomes of increasing diameters.11-13 The osteotome sinus-floor elevation (OSFE) was proposed for implant sites with at least 5 mm to 6 mm of bone between the alveolar crest and the maxillary sinus floor and ...
