The Forgotten Ape

This remarkable primate with the curious name is challenging established views on human evolution. The bonobo, least known of the great apes, is a female-centered, egalitarian species that has been dubbed the 'make-love-not-war' primate by specialists.

Bonobo: The Forgotten Ape: Amazon.co.uk: De Waal, Frans ...

The bonobo, least known of the great apes, is a female-centred, egalitarian species that has been dubbed the 'make-love-not-war' primate by specialists. In bonobo society, females form alliances to intimidate males, sexual behaviour (in virtually every partner combination) replaces aggression and serves many social functions, and unrelated groups mingle instead of fighting.

Bonobo: The Forgotten Ape: Amazon.co.uk: De Waal, Frans ...

The Bonobos are, as the subtitle explains, [the forgotten ape.]

Although as closely related to us as the more commonly know chimpanzee, not nearly as much is known of the bonobo. What is known, though, is fascinating.

## Bonobo: The Forgotten Ape | NHBS Academic & Professional Books

But often they know less about a primate that is equally close and just as fascinating – the bonobo, “the forgotten ape.” Like chimpanzees, bonobos share more than 98 percent of DNA with humans. But bonobos, though sometimes violent, are more peaceable. They live in matriarchal groups and famously use sex as a social tool – to manage conflict and tension or even just say “hello.”

In this thoroughly engaging book, leading primatologist and thinker Frans de Waal offers a heartening, illuminating new perspective on human nature. Bringing together his pioneering research on primate behavior, the latest findings in evolutionary biology, and insights from moral philosophy, de Waal explains that we don't need the specters of God or the law in order to act morally. Instead, our moral nature stems from our biology—specifically, our primate social emotions, which include empathy, reciprocity, and fairness. We can glimpse this in the behavior of our closest relatives in the animal kingdom: chimpanzees soothe distressed neighbors, and bonobos will voluntarily open a door to offer a companion access to their own food. Building on a wealth of evidence, de Waal reveals that morality is not dictated to us by religion or social strictures. Rather, it is the inevitable product of our biological nature.

A young woman follows her fiancé to war-torn Congo to study extremely endangered bonobo apes—who teach her a new truth about love and belonging. In 2005, Vanessa Woods accepted a marriage proposal from a man she barely knew and agreed to join him on a research trip to the Democratic Republic of Congo, a country reeling from a brutal decade-long war that had claimed the lives of millions. Settling in at a bonobo sanctuary in Congo's capital, Vanessa and her fiancé entered the world of a rare ape with whom we share 98.7 percent of our DNA. She soon discovered that many of the inhabitants of the sanctuary—ape and human alike—are refugees from unspeakable violence, yet bonobos live in a peaceful society in which females are in charge, war is nonexistent, and sex is as common and friendly as a handshake. A fascinating memoir of hope and adventure, *Bonobo Handshake* traces Vanessa's self-discovery as she finds herself falling deeply in love with her husband, the apes, and her new surroundings while probing life's greatest question: What ultimately makes us human? Courageous and extraordinary, this true story of revelation and transformation in a fragile corner of Africa is about looking past the differences

# Read Book Bonobo The Forgotten Ape

between animals and ourselves, and finding in them the same extraordinary courage and will to survive. For Vanessa, it is about finding her own path as a writer and scientist, falling in love, and finding a home. Watch a Video

When a family of bonobo apes who know American Sign Language are kidnapped from a language laboratory, their mysterious appearance on a reality TV show propels scientist Isabel Duncan, together with reporter John Thigpen, on a personal mission to rescue them. An entertaining book that calls into question our assumptions about these animals who share 99.4% of our DNA.

The bonobo, along with the chimpanzee, is one of our two closest living relatives. Their relatively narrow geographic range (south of the Congo River in the Democratic Republic of Congo) combined with the history of political instability in the region, has made their scientific study extremely difficult. In contrast, there are dozens of wild and captive sites where research has been conducted for decades with chimpanzees. Because data sets on bonobos have been so hard to obtain and so few large-scale studies have been published, the majority of researchers have treated chimpanzee data as being representative of both species. However, this misconception is now rapidly changing. With relative stability in the DRC for over a decade and a growing community of bonobos living in zoos and sanctuaries internationally, there has been an explosion of scientific interest in the bonobo with dozens of high impact publications focusing on this fascinating species. This research has revealed exactly how unique bonobos are in their brains and behavior, and reminds us why it is so important that we redouble our efforts to protect the few remaining wild populations of this iconic and highly endangered great ape species.

The first edition of Frans de Waal's *Chimpanzee Politics* was acclaimed not only by primatologists for its scientific achievement

# Read Book Bonobo The Forgotten Ape

but also by a much broader audience of politicians, business leaders, and social psychologists for its remarkable insights into very basic human needs and behaviors. In this revised edition—featuring a new gallery of color photographs along with a new introduction and epilogue—de Waal expands and updates his story of the Arnhem colony and its continuing political upheavals. We learn the fate of many memorable chimpanzees and meet the colony's current leaders and their allies. The new edition remains a detailed and thoroughly engrossing account—of sexual rivalries and coalitions, of actions governed by intelligence rather than instinct—and it reaffirms the complex bond between humans and their closest living relatives. As we watch the chimpanzees of Arnhem behave in ways we recognize from Machiavelli (and from the nightly news), de Waal reminds us again that the roots of politics are older than humanity.

From the New York Times bestselling author of *Mama's Last Hug* and *Are We Smart Enough to Know How Smart Animals Are?*, a provocative argument that apes have created their own distinctive cultures. In *The Ape and the Sushi Master*, eminent primatologist Frans de Waal corrects our arrogant assumption that humans are the only creatures to have made the leap from the natural to the cultural domain. The book's title derives from an analogy de Waal draws between the way behavior is transmitted in ape society and the way sushi-making skills are passed down from sushi master to apprentice. Like the apprentice, young apes watch their group mates at close range, absorbing the methods and lessons of each of their elders' actions. Responses long thought to be instinctive are actually learned behavior, de Waal argues, and constitute ape culture. A delightful mix of intriguing anecdote, rigorous clinical study, adventurous field work, and fascinating speculation, *The Ape and the Sushi Master* shows that apes are not human caricatures but members of our extended family with their own resourcefulness and dignity.

"Filippo Aureli and Frans De Waal have succeeded in cross-fertilizing fields as disparate as ethology and medieval law to create a rich new field of research -- natural conflict resolution. It makes one see conflict resolution among humans through a new and fascinating lens. This is a landmark contribution!"  
—William Ury, co-author Getting to YES, author of Getting Past No and Getting to Peace

The Development of an Extraordinary Species We human beings share 98 percent of our genes with chimpanzees. Yet humans are the dominant species on the planet -- having founded civilizations and religions, developed intricate and diverse forms of communication, learned science, built cities, and created breathtaking works of art -- while chimps remain animals concerned primarily with the basic necessities of survival. What is it about that two percent difference in DNA that has created such a divergence between evolutionary cousins? In this fascinating, provocative, passionate, funny, endlessly entertaining work, renowned Pulitzer Prize-winning author and scientist Jared Diamond explores how the extraordinary human animal, in a remarkably short time, developed the capacity to rule the world . . . and the means to irrevocably destroy it.
