The heart is a muscle that contracts and relaxes, pumping blood through the body; The heart cavity is divided into two atria and two ventricles separated by cardiac valves; Blood supply goes into the heart via the coronary arteries and is drained via the coronary veins

Cardiac system 1: anatomy and physiology | Nursing Times
Anatomy of the Heart The cardiovascular system can be compared to a muscular pump equipped with one-way valves and a system of large and small plumbing tubes within which the blood travels. Heart Structure and Functions The modest size and weight of the heart give few hints of its incredible strength.

Cardiovascular System | Anatomy and Physiology. The cardiovascular system relates to the heart, blood vessels, and blood. Blood contains proteins in its red blood cells called as hemoglobin which carries oxygen to cells and tissues in the body. The cardiovascular system can be deemed as the transport system of the body.

Cardiovascular System - Anatomy And Physiology
Understanding normal cardiac anatomy and physiology is an important component of performing ACLS. The heart is a hollow muscle comprised of four chambers surrounded by thick walls of tissue (septum). The atria are the two upper chambers and the ventricles are the two lower chambers.

(ACLS) Normal Heart Anatomy and Physiology
The deep cardiac plexus is located on the bifurcation of the trachea, and the superficial cardiac plexus is located on the base of the heart below the arch of the aorta. The autonomic nervous system is made up of a two-neuron chain (using the presynaptic neuron and the postsynaptic neuron) from the central nervous system to the heart.

The Physiology of the Human Heart - dummies
The circulatory system | or cardiovascular system | consists of the heart and the blood vessels. The heart, the main organ of the circulatory system, causes blood to flow. The heart's pumping action squeezes blood out of the heart, and the pressure it generates forces the blood through the blood vessels.

The heart: Anatomy, how it works, and more
The cardiovascular system has several characteristics that makes it unique and amazingly complicated. The goal of cardiovascular anatomy and physiology is to describe and explain the anatomical and physical elements that are responsible for the origin, development and function of this particular system.

Cardiovascular Anatomy and Physiology: Basic Principles ...
The cardiac conduction system involves the spread of electrical activity from the sinoatrial node, to the atrioventricular node, down the bundle of His and along the Purkinje fibres. As the electrical activity spreads along the heart's conduction system it initiates myocardial contraction in the surrounding myocardial tissue.

The wall of the heart consists of three layers: The epicardium is the visceral layer of the serous pericardium. The myocardium is the muscular part of the heart that consists of contracting cardiac muscle and noncontracting Purkinje fibers that conduct nerve impulses. Cardiac cells (cardiomyocytes) are in this layer.
