It is well known that hydraulic machinery usually suffers from severe vibration, noise, material damage, etc. due to cavitation. This is the reason why cavitation in hydraulic machinery has attracted our interests for decades. Hydraulic machinery, such as pumps, hydro tur- bines,

of flow static pressure may not fall below the vapor pressure of the liquid. These parameters to control cavitation are pressure head, flow rate and exit pressure of the liquid. The control parameters for cavitation free operation of hydraulic turbines can be obtained by conducting tests

machinery

Cavitation is a phenomenon in which rapid changes of pressure in a liquid lead to the formation of small vapor-filled cavities in places where the pressure is relatively low. When subjected to higher pressure, these cavities, called "bubbles" or "voids",

# Download Free Cavitation Of Hydraulic Machinery

collapse and can generate a shock wave that is strong very close to the bubble, but rapidly weakens as it propagates away from the bubble. Cavitation is a significant cause of wear in some engineering contexts. Collapsing voids that implode near

Cavitation - Wikipedia

The product of excessive vacuum conditions created at the hydraulic pump ' s inlet (supply side), cavitation is the formation, and collapse of vapors within a hydraulic pump. High vacuum creates vapor bubbles within the oil, which are

# Download Free Cavitation Of Hydraulic Machinery

carried to the discharge (pressure) side. These bubbles then collapse, thus cavitation.

Cavitation in Hydraulic Machinery 8.1

INTRODUCTION Cavitation is caused by local vaporization of the fluid, when the local static pressure of a liquid falls below the vapor pressure of the liquid. Small bubbles or cavities filled with vapor are formed, which sud

denly collapse on moving forward with the flow into regions of high pressure.

Cavitation in Hydraulic Machinery or otherwise it tends to enter the pump suction line. To counter the phenomenon of cavitation in pumps,

## Download Free Cavitation Of Hydraulic Machinery

the following steps are recommended by manufacturers:

1. Suction velocities to be kept below 1.5 m/s (5 ft/s)
2. Pump inlet lines to be kept as short as possible
3. Pump to be mounted as close to the reservoir as possible
4. Low-pressure drop filters to be used in the suction line
- 5.
