Carcinoembryonic antigen (CEA) is a

glycoprotein, which is present in

normal mucosal cells but increased

amounts are associated with

adenocarcinoma, especially colorectal

cancer. CEA therefore has a role as a

tumour marker. Sensitivity and

specificity are low, however, so it is of

more use for monitoring than for

screening or diagnosis.

Carcinoembryonic Antigen (CEA).

Tumour Markers; info | Patient  
by Dr. C.H. Weaver M.D. updated  
10/2020 What is the  
Carcinoembryonic antigen (CEA)? CEA  
is an antigen (small protein) that is  
found on the surface of many types of  
cancer cells and high levels of CEA  
can be detected in the blood of some  
patients with cancer and the  
developing fetus.

## Understanding The CEA Test in Colon Cancer

A carcinoembryonic antigen (CEA) test  
is used to check how well treatment is  
working in certain types of cancer,  
particularly colon cancer..

Carcinoembryonic antigens are  
substances (usually proteins) that are  
produced by some types of cancer. In  
response to the antigens, the body  
produces antibodies to help fight

them.

## Carcinoembryonic antigen (CEA) test - NHS

CEA levels return to normal within 4-6 weeks after surgical resection of the tumor. If CEA levels begin to rise after some time, it can suggest relapse of the cancer [3]. Lung cancer. CEA sensitivity is insufficient for it to be used as a method of screening for lung cancer. In lung cancer CEA levels also predict an advanced disease.

## CEA Tumor Marker - Normal Ranges, Elevated Levels, Lung Cancer

A normal level of CEA is less than or equal to 3 nanograms per milliliter (ng/mL). Most healthy people have levels below this amount. CEA levels will generally return to normal between one and four...

**CEA: Purpose, Procedure, and Results**  
Carcinoembryonic antigen (CEA) is used as a tumor marker. An elevated or rising CEA level indicates cancer progression or recurrence. Read on to learn about the meaning of different CEA blood ranges, the CEA test, and how to know what a healthy blood test range is for CEA.

**Carcinoembryonic Antigen (CEA)  
Cancer Blood Test**  
Carcinoembryonic antigen (CEA) describes a set of highly related glycoproteins involved in cell adhesion. CEA is normally produced in gastrointestinal tissue during fetal development, but the production stops before birth. Consequently, CEA is usually present at very low levels in the blood of healthy adults (about 2-4

ng/mL). However, the serum levels are raised in some types of cancer, which ...

Carcinoembryonic antigen - Wikipedia  
Most normal persons have detectable concentrations of circulating CEA. Approximately 85% of adults have CEA levels less than 2.5 ng/mL, while 95% have levels less than 5.0 ng/mL. CEA levels are slightly higher in men than women. The median level is 3.4 ng/mL in men and 2.5 ug/mL in women. Healthy persons seldom have levels above 10 ng/mL.

CEA-CA Series CEA(N)-CA(N) made of  
AISI 316

MCA, CA 15-3, CEA and CA 125  
were determined in the serum of 49  
patients with metastatic breast cancer  
and 38 patients with metastatic  
adenocarcinoma of other primary  
sites. By using the 99th percentile of  
the normal value distribution as the  
cutoff point, the positive predictive  
value (PV +) was found to be 85%  
(95% CI 76-94) for MCA, and 71%  
(95% CI 61-81) for CA 15-3.

The value of MCA, CA 15-3, CEA and  
CA 125 for ...
