Chemical kinetics is the study of how fast chemical reactions occur and of the factors that affect these rates. The study of reaction rates is closely related to the study of reaction mechanisms, where a reaction mechanism is a theory that explains how a reaction occurs.

Chemical Kinetics Reaction rates is the change in the concentration of a reactant or a product with time (M/s).
 $A \text{ rate} = - \frac{D[A]}{Dt}$ $B \text{ rate} = \frac{D[B]}{Dt}$
 $\frac{D[A]}{Dt}$ = change in concentration of A over time period Dt
 $\frac{D[B]}{Dt}$ = change in concentration of B over time period Dt
Because [A] decreases with time, $\frac{D[A]}{Dt}$ is negative.

Chemical change is guided and driven by energetics, but the actual route it takes and the speed with which it occurs is the subject of "dynamics". Dynamics is itself divided into two general areas: kinetics, which deals with the rate of change and is the subject of this lesson.

Reaction dynamics is a field within physical chemistry, studying why chemical reactions occur, how to predict their behavior, and how to control them. It is closely related to chemical kinetics, but is concerned with individual chemical events on atomic length scales and over very brief time periods. It considers state-to-state kinetics between reactant and

Great job in covering most of the fundamentals of diverse areas of chemical kinetics in such small pages! Would have given five stars only if it discussed molecular reaction dynamics in a bit more detail.
