In chemistry, acids and bases have been defined differently by three sets of theories. One is the Arrhenius definition, which revolves around the idea that acids are substances that ionize (break off) in an aqueous solution to produce hydrogen (H +) ions while bases produce hydroxide (OH -) ions in solution.

Bases can be thought of as the chemical opposite of acids. A reaction between an acid and base is called a neutralization reaction. The strength of an acid refers to its ability or tendency to lose a proton; a strong acid is one that completely dissociates in water.

Svante Arrhenius Acids and Bases. The Arrhenius theory of acids and bases dates back to 1884, building on his observation that salts, such as sodium chloride, dissociate into what he termed ions when placed into water. acids produce H^+ ions in aqueous solutions. bases produce OH^- ions in aqueous solutions.

Water is the base that reacts with the acid HA , A^- is the conjugate base of the acid HA , and the hydronium ion is the conjugate acid of water. A strong acid yields 100% (or very nearly so) of H_3O^+ and A^- when the acid ionizes in water; Table 1 lists several strong acids. A weak acid gives small amounts of H_3O^+ and A^- .

Acidity is the quality that gives liquids such as vinegar and lemon juice their lip-puckering taste. In fact, the term acid comes from the Latin term *acere*, which means "sour". The chemical opposites of acids are bases, compounds that often feel soapy or slippery and lend bitterness to foods such as walnuts and broccoli.

Acids with a low pH of around 1 are very reactive and can be dangerous. The same is true for bases of a pH near 13. Chemists use strong acids and bases to get chemical reactions in the lab. Although they can be dangerous, these strong chemicals can also be helpful to us.

Kids science: Acids and Bases - Ducksters

While there are many slightly different definitions of acids and bases, in this lesson we will introduce the fundamentals of acid/base chemistry. In the seventeenth century, the Irish writer and amateur chemist Robert Boyle first labeled substances as either acids or bases (he called bases alkalies), according to the following characteristics:

The first definition of Acids and Bases was given by Arrhenius and according to his theory, acids dissociate in water to form protons (H^+) and bases dissociate in water to form ($-OH$): The restriction of this theory spread mostly on organic bases since they do react with acids but they are not hydroxide ions.

Arrhenius Acid: By this definition, an acid is a substance that increases the concentration of hydronium ions (H_3O^+) when added to water. You might also consider increasing the concentration of hydrogen ion (H^+) as an alternative.; **Brønsted-Lowry Acid:** By this definition, an acid is a material capable of acting as a proton donor. This is a less restrictive definition because solvents ...

Acids, bases and the pH scale Acids are molecules that split apart in water and release hydrogen ions. Think about hydrochloric acid (HCl). When HCl is added to water, it splits into H^+ (hydrogen ions) and Cl^- (chlorine ions).

Salts of strong acids and strong bases ("strong salts") are non-volatile and often odorless, whereas salts of either weak acids or weak bases ("weak salts") may smell like the conjugate acid (e.g., acetates like acetic acid and cyanides like hydrogen cyanide) or the conjugate base (e.g., ammonium salts like ammonia) of the component ions.

Common laboratory acids include hydrochloric acid (HCl), sulfuric acid (H₂SO₄) and nitric acid (HNO₃). Common laboratory bases include potassium hydroxide (KOH), magnesium oxide (MgO), calcium carbonate (CaCO₃) and sodium hydrogen carbonate (NaHCO₃). A strong acid or base completely ionises in solution.
