Fortran was developed in the early 1950s and the first ever Fortran program ran in 1954 - making Fortran fairly unusual among programming languages in that it predates the modern transistor computer - the first Fortran program ran on the IBM 704 vacuum tube computer! Fortran has outlived several nation states since its conception, and still is in wide use today in a number of specialised scientific communities.

Many early programming languages, including Fortran, Cobol and the various IBM assembler languages, used only the first 72 columns of a card - a tradition that traces back to the IBM 711 card reader used on the IBM 704/709/7090/7094 series (especially the IBM 704, the first mass-produced computer with floating point arithmetic hardware), which could only read 72 of the 80 columns in one pass.
