Control systems engineering / I.J. Nagrath, M. Gopal – Details – Trove It emphasizes the interdisciplinary nature of the subject and examples have been drawn from various engineering disciplines to illustrate the basic system concepts.

Focuses on the first control systems course of BTech, JNTU, this book helps the student prepare for further studies in modern control system design. It offers a profusion of examples on various aspects of study.

About the book... The book provides an integrated treatment of continuous-time and discrete-time systems for two courses at postgraduate level, or one course at undergraduate and one course at postgraduate level. It covers mainly two areas of modern control theory, namely; system theory, and multivariable and optimal control. The coverage of the former is quite exhaustive while that of latter is adequate with significant provision of the necessary topics that enables a research student to comprehend various technical papers. The stress is on interdisciplinary nature of the subject. Practical control problems from various engineering disciplines have been drawn to illustrate the potential concepts. Most of the theoretical results have been presented in a manner suitable for digital computer programming along with the necessary algorithms for numerical computations.

Key Features:Examples have been provided to maintain the balance between different disciplines of engineering. Robust control, Robotic control and Robotic modeling introduced. PID learning procedures illustrated. Updation of obsolete technology with examples. State variable formulation and design simplified. Digital control, both classical and modern approaches, covered in depth. Chapters on Nonlinear Systems, Adaptive, Fuzzy Logic and Neural Network Control included. An appendix in MATLAB with examples from time and frequency domain analysis and design included.About the Book:The book provides an integrated treatment of continuous and discrete-time systems for two courses at undergraduate level or one course at postgraduate level. The stress is on the interdisciplinary nature of subject and examples have been drawn from various engineering disciplines to illustrate the basic system concepts. A strong emphasis is laid on modeling of practical systems involving hardware; control components of a wide variety are comprehensively covered. Time and frequency domain techniques of analysis and design of control systems have been exhaustively treated and their interrelationship established.Adequate breadth and depth is made available for second course. The coverage includes digital control systems: analysis, stability and classical design; state variables for both continuous and discrete-time systems; observers and pole-placement design; Liapunov stability; optimal control; and recent advances in control systems: adaptive control, fuzzy logic control, neural network control.
