The dihybrid cross had for grain phenotypes in the ear of genetic corn and they were red and smooth (RS), red and wrinkled (Rs), yellow and smooth (rS), and yellow and wrinkled (rs). In addition to our previous dominant and recessive genes of red (R) and (r), S represents a smooth texture dominant to s which is a wrinkled texture.

A Carolina Essentials™ Activity. Overview. Corn is the ideal organism for introducing students to Mendelian genetics. Corn kernels express numerous phenotypes that are easy to recognize. The phenotypes typically used involve the color or shape of the kernel. Carolina maintains parental stocks of yellow and purple corn colors. Purple corn is the result of a dominant allele, and yellow corn is the result of the recessive allele of the same gene.

Dihybrid two traits that result from two separate genes on two separate chromosomes. The physical appearance of the corn kernels helps determine the phenotype of two characters: kernel color and carbohydrate content. There are two different alleles for each gene: purple vs. yellow, and starch (plump) vs. sweet (wrinkled). The results of your counting will describe: Mendel's Laws of Inheritance (The Law of Segregation and The Law of Independent Assortment).
