Contrastive analysis has greatly benefited from corpus-based approaches because corpus linguistics is inherently comparative in that not only are corpora always "pre-eminently suited for comparative studies" (Aarts 1998), but corpus analysis techniques are also comparative in essence (Xiao and McEnery 2010: 175).

This book is organized in three sections. The three articles in Section one introduce the disciplines of Contrastive Linguistics (CL) and Translation Studies (TS), tracing their evolution in recent history and outlining the role played by the computer corpus in revitalising and redirecting research in each discipline. The six articles in Section two are a series of case studies, showing the

range of variables that have to be taken into consideration in CL and TS. The four articles in Section three all deal with practical issues of corpus exploitation, both the software tools that can be used to support analysis and the ways in which multilingual and monolingual corpora can be used to improve teaching and translation materials. -- pref.

The practice of comparing languages has a long tradition characterized by a cyclic pattern of interest. Its meeting with corpus linguistics in the 1990s has led to a new sub-discipline of corpus-based contrastive studies. The present volume tackles two main challenges that had not yet been fully addressed in the literature, namely an empirical assessment of the nature of the data commonly used in cross-linguistic studies

(e.g. translation data versus comparable data), and the development of advanced methods and statistical techniques suitably adapted to contrastive research settings. The papers collected in this volume endeavour to find out what (new) types of data are most useful for what kind of contrastive questions, and which advanced statistical techniques are most suited to deal with the multidimensionality of contrastive research questions. Answers to these questions are provided through the contrastive analysis of various language pairs or groups, and a wide

articles. Using a self-constructed corpus of scientific research articles, the authors make cross-linguistic comparisons in terms of the quantity and distribution patterns of categories of appraisals. They creatively categorise articles into theoretical scientific research articles and applied studies and discover that for both languages, each genre can have its own favorite mode of distribution for the realization of appraisal systems. In addition, this research helps appraisal theory systems to become more explicit, specific, and more applicable for the

This book is concerned with cross-linguistic contrast of major grammatical categories in English and Chinese, two most important yet genetically different world languages. This genetic difference has resulted in many subsidiary differences that are, among other things, related to grammar. Compared with typologically related languages, cross-linguistic contrast of

English and Chinese is more challenging yet promising. The main theme of this book lies in its focus on cross-linguistic contrast of aspect-related grammatical categories, or, grammatical categories that contribute to aspectual meaning - both situation aspect at the semantic level and viewpoint aspect at the grammatical level - in English and Chinese. The unique strength of this volume lies in that it is first corpus-based book contrasting English and Chinese. Given that the state of the art in language studies is to use corpora, the significance of the marriage between contrastive
