Pricing Credit Default Swaps - Term Structure Models II ...

The main idea of a Credit Default Swap (CDS) is to transfer the credit risk of a reference entity from one to another party. In a CDS the party A (protection buyer) pays a periodic insurance premium ("spread") 1 to the counterparty B (protection seller) until the maturity, or until the reference entity defaults. On the other hand the protection buyer receives a payoff from the protection seller only if the reference entity experiences a credit event.

Price: Returns primarily the swap's price for given pricing model, yield curve and credit curve inputs. Note that the Price function may also return several other values beyond the price of the swap by setting the value for the Output key accordingly. More on that below.

Credit Default Swap (CDS) Pricing in Excel using QuantLib ...

Credit default swaps are largely a speculative investment, since each side of the swap is hedging their bets for or against a credit default. When used correctly, a CDS can be a useful way to manage portfolio risk associated with the underlying fixed-income securities. However, there are still dangers associated with credit default swaps.

How Does a Credit Default Swap Work? - SmartAsset

A credit default swap (CDS) is a type of credit derivative that provides the buyer with protection against default and other risks. The buyer of a CDS makes periodic payments to the seller until the credit maturity date. In the agreement, the seller commits that, if the debt issuer defaults, the seller will pay the buyer all premiums and interest.
