The explosion in data exchange fostered by the success of the Web has restated semantics as a kernel issue in the development of services providing data and information to users and applications worldwide.

This newly designated conference series on "Semantics for the Networked World" unifies into a single framework the previous series on "Database Semantics" and "Visual Database Systems" that the IFIP WG 2.6 has been offering since

1985. Whereas the intent of the conference series is to explore interesting research issues related to semantics, the theme for the 2004 edition is "Semantics for Grid Databases". Grid computing, a new field concentrating on "flexible, secure, coordinated resource sharing among dynamic collections of individuals, institutions, and resources (also referred to as virtual organizations)", has gathered momentum in the context of providing shared infrastructures for large-scale scientific computations and data analysis. Similarly, P2P computing has attracted substantial attention. Currently, attention is devoted to the provision of middleware services to make computational resources interoperable

at the technical level and to increase the efficiency of use of physical resources. However, as Grid and P2P computing infrastructures are being increasingly adopted, they are likely to have typical problems of information overload that manifest themselves in any large-scale infrastructure for information and application sharing (e.g., the WWW). The need for resource discovery, application and service interoperability, integration and composition manifest themselves in these infrastructures. The ability to interoperate at the semantic level will largely determine the continued success and utilization of these infrastructures
