Secondly, even within a single deformation, mechanisms and
microstructures vary from mineral to mineral within a
polymineralic rock: a common example is the intracrystalline
plasticity of quartz in a shear zone at greenschist facies, that
contrasts with cataclastic deformation of feldspar in the
same conditions.

After introducing three main classes of deformation microstructures and mechanisms, low- to high-grade deformation is presented in a logical sequence in Chapters 2 to 5. Magmatic/submagmatic deformation, shear sense indicators, and shock microstructures and metamorphism are described in Chapters 6 to 8, which are innovative chapters in a structural geology textbook.

Deformation mechanisms and microstructures. When strain accumulates in a deforming rock, certain deformation processes occur at the micro-scale that allow the rock to change its internal structure, shape or volume. The processes involved may vary and in the plastic regime there are other and different processes.

Therefore, mechanical properties of WAAM alloys would be improved by the deformation strengthening mechanism after rolling, accompanying with distinct microstructures. The grain orientation, texture, grain sizes, and boundary misorientation angle distribution information were analyzed with EBSD and the CHANNEL 5 software.

Deformation mechanism refers to the various processes occurring at micro-scale that are responsible for changes in a material's internal structure, shape and volume. The process involves planar discontinuity and/or displacement of atoms from their original position within the crystal lattice system. These small changes are preserved in various microstructures of materials such as rocks, metals ...

A sequence of deformation mechanisms was revealed under high rate and/or cryogenic sliding (strain rate $\sim 10^4 \text{ s}^{-1}$; liquid nitrogen temperature): First, nanoscale dislocation trace lines form beneath the surface during the first forward pass; Second, partial dislocation nucleation from the sliding surface accompanied by nano-twinning and abundant stacking faults in the backward pass; Third, formation of a nanocrystalline layer upon further sliding. Sliding induced surface roughening is ...

We use detailed EBSD measurements to reconstruct microstructures that constrain the relative contribution of specific deformation mechanisms operating in different parts of an active salt fountain. Deformation microstructure not only determines the properties of a deformed metal but also provides the driving force for recovery and recrystallization; recovery competes with recrystallization in restoring microstructure and properties and at the same time facilitates nucleation of recrystallization.
