BACKGROUND Diffusion is a process that allows ions or molecules to move from where they are more concentrated to where they are less concentrated. This process accounts for the movement of many small molecules across a cell membrane.

Diffusion allows cells

Diffusion Through a
Membrane Lab

Diffusion through a
Membrane

Introduction

Molecules are
constantly moving.

Download Free Diffusion

They move in straight lines unless they are deflected by other molecules or obstacles in their environment.

Diffusion is the process by which the collisions between molecules cause them to continually spread apart from each other.

Through A Membrane Lab
Answer Key

membrane, I like to do a lab that uses a plastic bag to model the cell (membrane).

It is a simple lab where students do very little except watch the process and record data and information. To set it up, you will need plastic bags, iodine, water, and corn starch.
