The purpose of this thesis is to quantify the economic costs associated with traffic crashes for 83 of the largest metropolitan areas in the United States and compare those costs to that of congestion. This was done by collecting injury and fatality data for each area and multiplying those by economic cost estimates for each developed by the FHWA. The findings of this analysis show that the economic cost of traffic crashes exceeds the economic costs of congestion in every metropolitan area studied. These results indicate that transportation safety deserves similar consideration to that of traffic congestion when allocation transportation funds.

This book on road traffic congestion in cities and suburbs describes congestion problems and shows how they can be relieved. The first part (Chapters 1 - 3) shows how congestion reflects transportation technologies and settlement patterns. The second part (Chapters 4 - 13) describes the causes, characteristics, and consequences of congestion. The third part (Chapters 14 - 23) presents various relief strategies - including supply adaptation and demand mitigation - for nonrecurring and recurring congestion. The last part (Chapter 24) gives general guidelines for congestion relief and provides a general outlook for the future. The book will be useful for a wide audience - including students, practitioners and researchers in a variety of professional endeavors: traffic engineers, transportation planners, public transport specialists, city planners, public administrators, and private enterprises that depend on transportation for their activities.

Unexpected delays due to traffic incidents represent a significant proportion of overall delay, especially in urban areas. The resulting uncertainty can represent major costs to businesses and travelers, as well as restrict employment opportunities. This study focuses on North Carolina's Interstate facilities and businesses across the State that rely on these facilities for their daily operations and are influenced by traffic congestion due to their shipping needs. The first portion of the study examines the occurrences and costs of unexpected delay for North Carolina businesses, using telephone and face-to-face interviews. Results show that delays due to incident-induced congestion impose significant costs, which may increase over time as expected congestion and the number of incidents on the North Carolina interstates continue to grow. These costs are most severe in the Manufacturing industrial sector and in the Charlotte metropolitan area. Additionally, numerous firms commented on the need for better communication between NCDOT and the business community. The second portion of the study is devoted to developing case studies to simulate the impact of strategies to reduce incident congestion costs in North Carolina. Results show that incident management assistance patrols and advanced traveler information systems can significantly reduce unexpected delays and associated costs. The implications of the findings for economic growth are discussed.
