In the fast correction scheme, the spark advance is decreased for the next engine cycle by a fixed amount (e.g., 5 degrees) whenever knock is detected. Then, the spark advance is incremented in one-degree increments every 5 – 20 crankshaft revolutions. The fast correction ensures that minimum time is spent under heavy knocking conditions.

Spark Advance - an overview | ScienceDirect Topics

Electronic control of ignition timing was introduced a few years later in 1975-'76 with the introduction of Chrysler's computer-controlled "Lean-Burn" electronic spark advance system. By 1979 with the Bosch Motronic engine management system, technology had advanced to include simultaneous control of both the ignition timing and fuel delivery.
