## **Endocrine System - Nursing Lecture**

The endocrine system is an amazingly complex system with many important roles throughout the body. It works alongside the nervous system to coordinate functions of of the different body systems. The endocrine system contains endocrine glands that release their products (known as hormones) directly into the bloodstream.

The endocrine system also plays a vital role in communication throughout our body. The endocrine system consist of glands located all through the body, which secrete hormones that regulate things such as metabolism. digestion, blood pressure, and growth. These two systems are not directly linked, however the two interact in many ways.

## **Hormones | Anatomy and Physiology**

15.2: An Overview of the Endocrine System Communication is a process in which a sender transmits signals to one or more receivers to control and coordinate actions. In the human body, two major organ systems participate in relatively “long distance” communication: the nervous system and the endocrine system.

A version of the OpenStax text

This is an integrated textbook on the endocrine system, covering the anatomy, physiology and biochemistry of the system, all presented in a clinically relevant context appropriate for the first two years of the medical student course. One of the seven volumes in the Systems of the Body series. Concise text covers the core anatomy, physiology and biochemistry in an integrated manner as required by system- and problem-based medical courses. The basic science is presented in the clinical context in a way appropriate for the early part of the medical course. There is a linked website providing self-assessment material ideal for examination preparation.
