Geology is the science of earth's crust (lithosphere) consisting of rocks and soils. While mining and mineralogical engineers are more interested in rocks, their petrology (formation) and mineralogy, civil engineers are equally interested in soils and rocks, in their formations, and also in their properties for civil engineering design and construction.

Surveying requires civil engineers to determine the relative positions of points that are at, above, and below the surface of the earth. This requires geological surveying tools and skills. For example, in order to determine how blueprint points transfer to the real world, civil engineers must use direct and indirect means to measure things like distance, elevation, and orientation.
