This is the first text to systematically review the evidence for obstetric anesthesia and analgesia. Evidence-based practice is now being embraced worldwide as a requirement for all clinicians; in the everyday use of anesthesia and analgesia for childbirth, anesthetists will find this synthesis of the best evidence an invaluable resource to inform their practice. Contributions from anesthetic specialists trained in the skills of systematic reviewing provide a comprehensive and practical guide to best practice in normal and caesarean section childbirth. This book, coming from one of the world's leading obstetric centers and the cradle of evidence-based medicine, is a much needed addition to the obstetric anesthesia literature.

Regional Analgesia in Obstetrics provides an account of the developments in the provision of regional analgesia and anaesthesia in obstetrics over the last decade. The book covers the attitudes to obstetric analgesia in different countries; the indications for regional analgesia in labour; the effects of regional analgesia on outcome; and operative delivery.

Pain Medicine Board Review is a comprehensive guide for preparing for the American Board of Medical Specialties (ABMS) certification or recertification in Pain Medicine, and for residents preparing for in-training examinations in Pain Medicine. The text is organized into 28 chapters covering topics such as Anatomy, Physiology of Pain, Pharmacology, Diagnosis of Pain, and various pain syndromes. Each section includes questions, answers, and detailed explanations with highlighted

key points, and concise further reading lists. Questions follow the ABMS style, and the explications of answers carefully address all points in the ABMS content outline for Pain Medicine. A section on imaging includes high quality magnetic resonance images, ultrasound images, fluoroscopic images and other images that will enable the examination candidate to answer questions that determine knowledge of pathological states as compared to normal and complications of treatments.

McMahon's name appears first on the 5th edition.

This comprehensive atlas, which includes a wealth of illustrations and anatomic pictures created by the editors, covers a broad range of both regional anesthesia and pain intervention techniques, including neuromodulation. The book is unique in that it covers ultrasound and fluoroscopic-guided techniques, as well as traditional landmark-guided techniques. The authors and editors are internationally renowned experts, and share extensive theoretic and practical insights into regional anesthesia, pain therapy and anatomic sciences for everyday practice. The book addresses the application of ultrasound and fluoroscopic guidance for pain interventions and provides detailed coverage of ultrasound-guided and landmark-guided regional anesthesia. The book represents a detailed guide to the application of regional anesthesia and pain medicine; furthermore, examples of medico-legal documentation are also included in this edition. The 5th edition of *Regional Nerve Blocks in Anesthesia and Pain Medicine* is practically oriented and

provides essential guidelines for the clinical application of regional anesthesia. It is intended for anesthesiologists and all professionals engaged in the field of pain therapy such as pain specialists, surgeons, orthopedists, neurosurgeons, neurologists, general practitioners, and nurse anesthetists.

Bonica's Management of Pain was the first major textbook written primarily to guide practitioners as a comprehensive clinical text in the field of pain medicine. We aim to build on Bonica's tradition to assemble an updated, comprehensive textbook for pain practitioners that is seen as the leading text in the field of pain medicine. Prior editions have been largely based on contributions from leading practitioners who described current practice; this revision will make every attempt to include concise summaries of the available evidence that guides current practice.

Now in its Fourth Edition, with a brand-new editorial team, Bonica's Management of Pain will be the leading textbook and clinical reference in the field of pain medicine. An international group of the foremost experts provides comprehensive, current, clinically oriented coverage of the entire field. The contributors describe contemporary clinical practice and summarize the evidence that guides clinical practice. Major sections cover basic considerations; economic, political, legal, and ethical considerations; evaluation of the patient with pain; specific painful conditions; methods for symptomatic control; and provision of pain treatment in a

variety of clinical settings.

This issue of Clinics in Perinatology will carry the reader through the perinatal period and examine pain management throughout that continuum. Beginning with the genetics of obstetrical pain and opioid use in pregnancy, the discussion moves to the provision of anesthesia to the mother and fetus during fetal surgery - an area of intense concern and interest in many centers. There is an extensive discussion of both pharmacologic and non-pharmacologic management of pain during delivery. A discussion of regional anesthetic techniques is increasingly relevant in light of increasing evidence of adverse neurodevelopmental consequences of fetal exposure to general anesthetics and sedatives. Pain, its implications and management, are extensively covered including discussions of how to assess neonatal pain and how best to provide sedation and non-pharmacologic pain management, systemic pharmacologic, or regional techniques. Of particular interest are the reviews of the potential neurodevelopmental impact of both the treatment and the failure to adequately treat pain in the newborn. This topic is receiving an enormous amount of attention from all those who care for children as well as government and the media.
