The empirical formulae estimating the liquefaction resistance of soils R_L directly from the penetration resistance, W_{sw} and N_{sw} , of Swedish weight sounding tests are firstly derived by combining the correlation between the values for W_{sw} and N_{sw} and relative density D_r and the relation between liquefaction resistance R_L and relative density D_r obtained in past studies. As a result, two empirical formulae are derived, one for sand and the other for sand with silt and silty sand.

Evaluation of liquefaction resistance of soils from ...

In order to compare liquefaction resistance from profiles that liquefied in a specific number of cycles with profiles that developed excess porewater pressures without liquefying (i.e., $r_u < 1$), we defined a simple capacity to demand ratio as follows: Capacity Demand = $C/D = \{N_L/20 \text{ cycles} \text{ or } N_R/20 \text{ cycles for } r_u = 1\}$ $r_u < 1$

Evaluation of reliquefaction resistance using shaking ...

The objective of this study was to evaluate the numerical capabilities of predicting liquefaction resistance for desaturated sands. A finite-element method (FEM) analysis was performed to simulate a large shaking table test (STT) that aimed to evaluate the desaturation ground improvement method for liquefaction mitigation.

liquefaction resistance. In the present study, a more robust procedure is proposed to estimate the liquefaction resistance of soils by means of SWS tests. 2. Derivation of proposed procedure The penetration resistance N_{sw} of SWS tests is known to be most largely dependent upon the effective confining stress, soil grading, soil density, etc.

Evaluation of liquefaction resistance of soils from ...

At present, there are two major methods for the evaluation of liquefaction potential, namely, laboratory test and in situ test. The in situ test method is widely used because it involves a small disturbance and is relatively good at representing the liquefaction potential.

Evaluation Method for the Liquefaction Potential Using the ...

v_0) is a suitable parameter to evaluate the liquefaction resistance of sands. Comparative studies have indicated that K_{dis} noticeably affects r to factors such as stress state/history (σ_h , OCR), pure prestraining, aging, cementation, structure! all factors increasing liquefaction resistance. Such factors are scarcely felt e.g. by q

Liquefaction Potential Evaluation by SDMT

Recent research showed that penetration-based approaches, such as CPT and seismic dilatometer tests, underestimated the liquefaction resistance of the pumice deposits (shown in Figure 1), confirming that any procedure where the liquefaction resistance is correlated with density will not work on pumiceous deposits (Orense et al. 2012; Orense and Pender 2013).

Complete Liquefaction- when a soil exhibits no resistance or negligible resistance over a wide range of strains (e.g. a double amplitude of 20%). Partial Liquefaction- when a soil exhibits no resistance to deformation over a strain range less than that considered to constitute failure.

Soil Liquefaction: Factor of Safety, Calculations, and ...

Following disastrous earthquakes in Alaska and in Niigata, Japan in 1964, Professors H. B. Seed and I. M. Idriss developed and published a methodology termed the [simplified procedure] for evaluating liquefaction resistance of soils. This procedure has become a standard of practice throughout North America and much of the world.

Dynamic Penetration Test (DPT): This test allows measurement and analysis of the resistance of the different strata of a soil before the possible risks of liquefaction through correlations and probabilistic methods. This method has many advantages: low economic cost, easy execution, data and codes available for verification of correlations, simple interpretation of results and relatively short application time.

Liquefaction Phenomenon and Mitigation Strategies for Soil ...

RESISTANCE RATIO (CRR) Calculation, or estimation, of two variables is required for evaluation of liquefaction resistance of soils: (1) the seismic demand on a soil layer, expressed in terms of CSR; and (2) the capacity of the soil to resist liquefaction, expressed in terms of CRR. The latter variable has been termed the cyclic

LIQUEFACTION RESISTANCE OF SOILS:SUMMARY REPORT FROM THE ...

This paper presents simplified dilatometer test (DMT)-based methods for evaluation of liquefaction resistance of soils, which is expressed in terms of cyclic resistance ratio (CRR). Two DMT parameters, horizontal stress index (K_D) and dilatometer modulus (E_D), are used as an index for assessing liquefaction resistance of soils.

Simplified DMT-based methods for evaluating liquefaction ...

The standard approach for the evaluation of the liquefaction susceptibility is based on the estimation of a safety factor between the cyclic shear resistance to liquefaction and the earthquake induced shear stress.

SPT-Based Evaluation of Soil Liquefaction Risk

Uniform cyclic loading is commonly used in laboratory tests to evaluate soil resistance to earthquake-induced liquefaction, even if the cyclic stresses induced by earthquakes in the field are highly irregular. This paper discusses the use of stress and energy-based approaches to evaluate the liquefaction resistance of sand under irregular loading.

The participants developed consensus recommendations on the following topics: (1) use of the standard and cone penetration tests for evaluation of liquefaction resistance, (2) use of shear wave velocity measurements for evaluation of liquefaction resistance, (3) use of the Becker penetration test for gravelly soils, (4) magnitude scaling factors, (5) correction factors K_α and K_σ , and (6) evaluation of seismic factors required for the evaluation procedure.
