Evaluating proportion of No answers. For a Yes/No question, the proportion of Yes answers and the proportion of No answers must always add up to 1.

Thus:  $q = 1 - 0.068 = 0.932$ . Now we are ready to plug into the two

inequalities:  $n p = 59 \times 0.068 = 4.012$ .

and.  $n q = 59 \times 0.932 = 54.988$ .

If  $y$  is 0 and  $z$  is negative 1, it's going to be 0 plus negative 1. These can all be evaluated, and they'll essentially give you a value depending on the values of each of these variables that make up the expression. An equation, you're essentially setting expressions to be equal to each other.
