Geometrical Optics. When an object is dropped in still water, the circular wave fronts that are produced move out from the contact point over the two-dimensional surface. A light source emits light uniformly in all directions of the three-dimensional world. The wave fronts are spherical, and the direction of motion of the wave is perpendicular to the wave front, as depicted in Figure .

Geometrical Optics - CliffsNotes

It collects together the basic concepts and formulas of geometric optics in a clear and concise form, and also defines and explains common optical terminology (pupils, rays, FOV, NA, etc.). It reviews common optical systems like telescopes and

microscopes, and has sections on aberrations and chromatic effects.
