Solution: Game can be formally represented as follows:

$N = \{1, \dots, n\}$ where $n > 2$ is the number of players. $A_i = \{1, 2, \dots, 100\}$ Let $m(a) = \sum_i a_i / n$ be the average action; $u_i(a) = 1$ if $|a_i - 2m(a)/3| < |a_j - 2m(a)/3|$ for all $j \neq i$; $u_i(a) = 0$ if $|a_i - 2m(a)/3| > |a_j - 2m(a)/3|$ for some $j \neq i$

Find the dual problem of the following L.P. problem: $\max x_0 = 3x_1 + 2x_2$ s.t. $5x_1 + 2x_2 \leq 10$ $4x_1 + 6x_2 \leq 24$ $x_1 + x_2 \leq 1$
 $x_1 + 3x_2 = 9$ $x_1 \geq 0$. (1) Solution: We are going to use rules (1),(2) and (3) from your notes to find the dual of (1). $\min y_0$

Answer: The optimal solution is obtained by maximizing the payoff function $(\cdot) = -4/2$. The first-order maximization condition is $-8 = 0$ implying that $= 8$ is the optimal solution. For $= 1$ the solution is $= 1/8$ and for $= 4$ it is $= 1/2$. € (c) Show that in general, smaller people should drink less than larger people.

incompatible goals, game theory has played a role in a variety of different areas. Game theory has been fundamental in economics [11, both in the theoretical foundations of microeconomic theory and in more practical examples (such as the design of the 1995/6 FCC auction of wavelengths [221) .

A solution to a game describes the optimal decisions of the players, who may have similar, opposed, or mixed interests, and the outcomes that may result from these decisions. Although game theory can be and has been used to analyze parlour games, its applications are much broader.

It is a well developed discipline that has applications in areas such as business, politics and economics. Game theory is often based on highly constrained situations with clear rules and agents who act logically. As such, it doesn't always apply to real world situations where rules, behavior, risk and opportunity tend to be dynamic and ambiguous.

Nevertheless, game theory offers some useful models that can be applied to real world problems and decisions.

Games of perfect information have been studied in combinatorial game theory, which has developed novel representations, e.g. surreal numbers, as well as combinatorial and algebraic (and sometimes non-constructive) proof methods to solve games of certain types, including "loopy" games that may result in infinitely long sequences of moves. These methods address games with higher combinatorial complexity than those usually considered in traditional (or "economic") game theory.

Two-Person, Zero-Sum Game– Mixed Strategy Games

Reducible to a 2x2 Matrix By employing the principle of dominance, it may be possible to reduce the size of a game theory problem to a 2x2 matrix. For player A, the optimal strategy involves the simultaneous solution of: $x_1 v_{11} + x_2 v_{21} = x_1 v_{12} + x_2 v_{22}$ $x_1 + x_2 = 1$
