Gate Valves. Primarily used to turn on or shut-off the flow and are characterized by a traveling wedge. Ball Valves. Quick acting, bi-directional flow and has a low pressure drop with bubble tight shut-off. Globe Valves. Primarily used as control valves where throttling and shut-off are required. Check Valves.

GLT International - Leading Valves Design and Manufacturer
Gate valves are primarily used for stop valves fully opened or fully closed. They are not normally considered for throttling purposes, but more for slurries, viscous fluids, etc. Gate valves are characterized by a traveling wedge, which is moved with the operation of the stem nut. The wedge travels perpendicular to the direction of the flow.

A gate valve is a valve that opens by lifting a barrier (gate) out of the path of the fluid. Gate valves require very little space along the pipe axis and hardly restrict the flow of fluid when the gate is fully opened. The gate faces can be parallel but are most commonly wedge-shaped in order to be able to apply pressure on the sealing surface.

Gate valves are designed for fully open or fully closed service. They are installed in pipelines as isolating valves, and should not be used as control or regulating valves. Operation of a gate valve is performed doing an either clockwise to close (CTC) or clockwise to open (CTO) rotating motion of the stem.

Through Conduit Slab Gate Valves | BEL Valves
Gate Valve Gate valves use a movable door or gate to open and close the valve. This gate is lowered or raised using a mechanically assisted operator which is normally a threaded screw. Since gate valves can either be in the fully open or fully closed state, the resistance of the fluid flow when the valve is fully opened is smaller.
