This book explains how the beautiful goldfish body develops from a single fertilized egg and how this developmental process was changed during the process of domestication. The contents can be categorized as follows: i) numerous high-quality live photo images of embryonic and larval stage goldfish, ii) detailed descriptions of skeletogenesis with fluorescent microscopic and histological images, iii) the most advanced interpretation of the relationship between artificial selection and developmental processes, iv) future perspectives of the application of the genome editing techniques for the ornamental goldfish breeding, and v) methodological descriptions for goldfish developmental biology. Goldfish is a popular ornamental domesticated fish species, and its highly diverged morphological features and color variations attract fanciers. The goldfish has been spread all over the world by breeders, and this fish has also been employed as an experimental organism by researchers in the field of life science. However, so far, no available scientific books provide a detailed description of the embryogenesis and morphogenesis of this animal. Compared with the number of published fancier books, the number of books on goldfish biology is very few. This publication will be useful not only for the research community particularly in the fields of developmental biology, evolutionary biology, zoology, aquaculture, fishery science, and related areas but also for enthusiastic goldfish fanciers and breeders.

The goldfish, *Carassius auratus*, a member of the Carp family, Cyprinidae, has been domesticated for many hundreds of years, as a food fish, a laboratory animal and now most important commercially, for ornamental and aesthetic purposes. There are now many scores

of recognised varieties, which have been produced over time by selection processes and other methods described in detail in this stimulating book. *Goldfish Varieties and Genetics* covers all major aspects relating to goldfish breeding and genetics in a readable and user-friendly style. An account is presented of the domestication and evolution of the goldfish, including comprehensive details of the relevant genetic and biological principles involved in the development strategies and production of new varieties. The book also covers the subject of goldfish appreciation and the international significance of goldfish shows and show standards. The book concludes with an exciting forward look at the potential evolutionary future for the goldfish. This important and timely book brings together, for the first time, a wealth of scientific information, presented in a clear and understandable manner by Dr Joseph Smartt, who has many years' experience working in fish genetics and breeding. The book is a must-have purchase for all serious goldfish breeders, hobbyists and dealers, fish biologists and geneticists, aquarium keepers and aquaculture personnel. The author, Joseph Smartt is a Senior Visiting Research Fellow at the Department of Biological Sciences, University of Southampton, UK.
