guide to Rocks and Minerals*

A mineral is a pure
substance with a specific
composition and structure,
while a rock is typically a
mixture of several different
minerals (although a few
types of rock may include
only one type of mineral).
Examples of minerals are
feldspar, quartz, mica,
halite, calcite, and
amphibole.

given to a group of silicate minerals that have silicon and oxygen as their two major components. Muscovite is a member of the mica mineral group. It is more important as a rock-forming mineral than as a collectible specimen.

Olivine is a group of minerals that come from magma. It is important as a rock-forming mineral.

Rocks and minerals. Toggle
text. Earth's crust is made
up of many different types
of rocks. Over long periods
of time, many rocks change
shape and type as they are
transformed by wind, water,
pressure, and heat. All
rocks contain one or more
minerals.

*Rocks and Minerals for Kids
