Oxford Cases in Medicine and Surgery teaches students a hypothesis-driven, step-by-step, logical diagnostic approach to common patient presentations. This hands-on approach, which stimulates active learning, mirrors that used by successful clinicians on the wards, challenging students with questions at each stage of a case (history-taking, examination, investigation, management). In tackling these questions, students learn to integrate their existing knowledge and apply it to a real-life scenario from start to finish. Each chapter focuses on a common presenting symptom (e.g. chest pain), rather than a physiological system (e.g. cardiology). By starting with a symptom, as doctors do in reality, students learn to draw on their knowledge of different

physiological systems - for example, cardiology, respiratory, gastroenterology - at the same time. Within each chapter, a long case walks the student through a logical method for tackling patients presenting with a given symptom. Subsequent short cases test this learning, whilst reminding students to be wary of other conditions that may present in a similar way. All the major presenting symptoms in general medicine and surgery are covered, together with a broad range of pathologies.

This survival guide, written by junior doctors for junior doctors, provides a concise and easy to read tool for doctors delivering this care. It covers each surgical speciality in turn, addressing speciality specific emergencies; when to admit patients; and when to call for senior help, as well as offering guidance on common referrals and questions, post-operative complications and common medical emergencies in surgical patients. In addition, it outlines key practical skills often required in surgical specialties, providing a summary of necessary skills and tips and tricks for performing them safely and successfully. Lastly, with increasing
