Although the field of Neuro-Oncology has grown considerably in the last 10 to 15 years and has a rather extensive literature, there are no comprehensive, "single-source books that summarize the current literature and future trends of neuroimaging in neuro-oncology. This book covers this topic in more comprehensive fashion, making it an important addition to the armamentarium of physicians that care for patients with brain tumors and other neuro-oncological disorders. Well-founded in basic science, it includes chapters that provide an overview of relevant background material in critical areas such as physics, contrast agents, ultra-high field brain MRI, and molecular imaging.

Changes in the focus of neurological practice worldwide have led to the need for new standard texts that reflect the current state of this expanding area of clinical expertise. The second edition of the Handbook of Neurological Rehabilitation is a major reference source that fulfils this need, providing an invaluable resource for all professions that work with patients suffering from neurological disorders. It brings restorative neurology to the bedside and shows how a reiterative, goal-oriented, problem-solving training programme can benefit patients, sometimes on a scale not achieved by pharmacological or surgical interventions. The book is divided into three sections all of which have been updated. Section One explores the clinical and biological principles underpinning rehabilitation practice in the context of neurological disablement. Section Two describes the assessment, treatment, and management of the major physical, cognitive and behavioural impairments, and the resulting functional deficits that may follow or accompany neurological disease. The final section explores in more detail these problems and their management in relation to the more common specific disorders of the nervous system. The text emphasises the fact that rehabilitation is an ongoing process involving multidisciplinary problem-solving, goal-setting and education; in which organised care is more effective than unorganised care; and the breakdown of professional barriers within rehabilitation, to facilitate the use of combined treatment techniques, improves outcome. It describes the contribution made by neural reorganisation and compensatory mechanisms to recovery of function, focuses on the avoidance of secondary deficit, and explores the physical, cognitive, affective and behavioural problems that may occur after neurological damage. At a time when new medical technologies threaten to fragment the integrity of medical care at individual and societal levels, it is crucial that all those involved in the management of chronic neurological disease have a working knowledge of the contents of this book. Their perspective on clinical practice will then be truly integrated and holistic and their patients will benefit accordingly.

Handbook of Veterinary Neurology provides quick access to vital information on neurologic conditions in a wide range of species, including canine, feline, bovine, caprine, equine, ovine, and porcine. A problem-oriented approach makes it easy to diagnose and treat neurologic problems in small and large animals. The coverage of disorders by problem, not by established disease diagnosis, emulates how animals present to the veterinary hospital and simplifies the formulation of a correct diagnosis. Within each chapter, discussions of neurologic disease include a review of the localization criteria and the diseases that can cause that problem, plus treatment and surgical techniques. Lead author Michael D. Lorenz brings decades of experience to neurologic assessment, using a diagnostic approach that requires minimal knowledge of neuroanatomy. A problem-based approach is organized by presenting sign rather than by condition, guiding you to logical conclusions regarding diagnosis and treatment. Algorithms diagram the logic necessary to localize lesions and to formulate diagnostic plans. Coverage of current diagnostic techniques includes the use of diagnostic tools, such as radiology, spinal fluid analysis, electrodiagnosis, and MR imaging. Case histories in each chapter present a problem and the results of the neurologic examination, then ask you to solve the problem by localizing the lesion, listing probable causes, and making a diagnostic plan. Answers are provided at the back of the book. A consistent format for each case history includes signalment, history, physical examination findings, and neurologic examination. A comprehensive appendix describes species and breeds that have a congenital predisposition for particular neurologic diseases. Extensive references make it easy to pursue in-depth research of more advanced topics. A companion website includes 20 narrated video clips with accompanying PowerPoint slides that correlate to the case histories in the book, covering neurologic assessment and clinical problems such as paresis of one limb, tetraparesis, stupor, seizures, ataxia of the head and limbs, and cranial nerve disorders. Two new co-authors, Jean Coates and Marc Kent, board-certified in neurology, enhance the credibility of this edition. A full-color design and numerous illustrations include enhanced images of neuroanatomy and pathology.

Handbook of Decision Support Systems for Neurological Disorders provides readers with complete coverage of advanced computer-aided diagnosis systems for neurological disorders. While computer-aided decision support systems for different medical imaging modalities are available, this is the first book to solely concentrate on decision support systems for neurological disorders. Due to the increase in the prevalence of diseases such as Alzheimer, Parkinson's and Dementia, this book will have significant importance in the medical field. Topics discussed include recent computational approaches, different types of neurological disorders, deep convolution neural networks, generative adversarial networks, auto encoders, recurrent neural networks, and modified/hybrid artificial neural networks. Includes applications of computer intelligence and decision support systems for the diagnosis and analysis of a variety of neurological disorders Presents in-depth, technical coverage of computer-aided systems for tumor image classification, Alzheimer's disease detection, dementia detection using deep belief neural networks, and morphological approaches for stroke detection Covers disease diagnosis for cerebral palsy using auto-encoder approaches, contrast enhancement for performance enhanced diagnosis systems, autism detection using fuzzy logic systems, and autism detection using generative adversarial networks Written by engineers to help engineers, computer scientists, researchers and clinicians understand the technology and applications of decision support systems for neurological disorders

Handbook of Brain Tumor Chemotherapy, Molecular Therapeutics, and Immunotherapy, Second Edition, provides a comprehensive overview of the molecular methodologies in the neuro-oncology field. There have been profound changes in the landscape of approaches to

brain tumor therapy since the first edition—mainly in the areas of molecular biology and molecular therapeutics, as well as in the maturation of immunotherapy approaches (e.g., vaccines). This updated edition has a new, primary focus on multidisciplinary molecular methods, and is broadened to include the latest cutting-edge molecular biology, therapeutics, immunobiology and immunotherapy approaches. As the first comprehensive book to address the molecular research into these concepts, users will find it to be an invaluable resource on the topics discussed. Provides the most up-to-date information regarding conventional forms of cytotoxic chemotherapy, as well as the basic science and clinical application of molecular therapeutics for the treatment of brain tumors Broadly appeals to anyone interested in neuro-oncology and the treatment of brain tumors Features updated chapters on molecular biology, molecular therapeutics, maturation of immunotherapy approaches, and a focus on multidisciplinary molecular methods Includes a new section on the basic science of immunology, as well as thorough updates on the use of vaccine technology and immunotherapy for the treatment of brain tumors

This easy-to-use handbook is designed to assist in the evaluation and management of spinal cord injuries and the diverse related disorders and conditions. Spinal cord injuries can cause abnormalities in all body systems due to dysfunction of the somatic motor and sensory systems and damage to the autonomic nerve system. The latter gives rise to respiratory and cardiac problems, temperature regulation disorders, endocrine system disorders, and many associated metabolic disorders. Other potential consequences of spinal cord injuries include pressure injuries and various disabilities and obstacles, ranging from physical limitations to social embarrassment. This handbook offers extensive guidance on medical management in different scenarios from the acute phase to long-term care, with a particular focus on information of importance for the solution of clinical problems commonly encountered in daily practice. It will be ideal for practitioners in rehabilitation medicine, neurosurgery, orthopedics, neurology, and other relevant specialties that deal with patients with spinal cord injuries.

The most highly acclaimed and complete reference work on psychological assessment—fully updated and expanded Covering principles of assessment, evaluation, referral, treatment planning, and report writing, the latest edition of Gary Groth-Marnat's landmark Handbook of Psychological Assessment has been thoroughly revised and expanded. Written in a practical, skills-based manner, this classic resource offers coverage of the most widely used assessment instruments and has been updated to include new material and cover tests that are growing in popularity, such as brief assessment instruments. Handbook of Psychological Assessment also provides guidance on the most efficient methods for selecting and administering tests, how to interpret assessment data, and how to integrate test scores and develop treatment plans as well as instruction on ways in which to write effective, client-oriented, problem-solving psychological reports. The Fifth Edition provides thorough coverage of the most commonly used assessment instruments including the Wechsler Adult Intelligence Scale-Fourth Edition (WAIS-IV), Wechsler Intelligence Scale for Children-Fourth Edition (WISC-IV), Wechsler Memory Scale-Fourth Edition (WMS-IV), Minnesota Multiphasic Personality Inventory-2 (MMPI-2), California Psychology Inventory (CPI), Rorschach, Millon Clinical Multiaxial Inventory-III (MCMI-III), Thematic Apperception Test, Repeatable Battery for the Assessment of Neuropsychological Status (RBANS), brief assessment instruments, clinical interviewing, and behavioral assessment. In addition, this Fifth Edition includes: Updates on the new WAIS-IV, WISC-IV, and WMS-IV An increased emphasis on diversity A focus on screening for

neuropsychological impairment, including coverage of the Repeatable Battery for the Assessment of Neuropsychological Status (RBANS) Coverage of the Minnesota Multiphasic Personality Inventory-2-Restructured Form New information on client feedback and consultation An updated chapter on psychological report writing, including new examples of psychological reports Organized according to the sequence mental health professionals follow when conducting an assessment, Handbook of Psychological Assessment, Fifth Edition is a practical, valuable reference for professionals looking to stay current as well as for students looking for the most thorough and trusted resource covering the field of psychological assessment.

This essential handbook for emergency clinicians integrates neurology with the practical demands of emergency care.

Advances in our understanding of the brain and rapid advances in the medical practice of neurology are creating questions and concerns from an ethical and legal perspective. Ethical and Legal Issues in Neurology provides a detailed review of various general aspects of neuroethics, and contains chapters dealing with a vast array of specific issues such as the role of religion, the ethics of invasive neuroscience research, and the impact of potential misconduct in neurologic practice. The book focuses particular attention on problems related to palliative care, euthanasia, dementia, and neurogenetic disorders, and concludes with examinations of consciousness, personal identity, and the definition of death. This volume focuses on practices not only in North America but also in Europe and the developing world. It is a useful resource for all neuroscience and neurology professionals, researchers, students, scholars, practicing clinical neurologists, mental health professionals, and psychiatrists. A comprehensive introduction and reference on neuroethics Includes coverage of how best to understand the ethics and legal aspects of dementia, palliative care, euthanasia and neurogenetic disorders Brings clarity to issues regarding ethics and legal responsibilities in the age of rapidly evolving brain science and related clinical practice
