science and control theory. The book presents a broad set of tools for understanding coordination algorithms, determining their correctness, and assessing their complexity; and it analyzes various cooperative strategies for tasks such as consensus, rendezvous, connectivity maintenance, deployment, and boundary estimation. The unifying theme is a formal model for robotic networks that explicitly incorporates their communication, sensing, control, and processing capabilities--a model that in turn leads to a common formal language to describe and analyze coordination algorithms. Written for first- and second-year graduate students in control and robotics, the book will also be useful to researchers in control theory, robotics, distributed algorithms, and automata theory. The book

than in previous editions. Book 1: Materials and Mechanical Design is divided into two parts that go hand-in-hand. The first part covers metals, plastics, composites, ceramics, and smart materials, providing expert advice on common uses of specific materials as well as what criteria qualify them as suitable for particular applications. Coverage in the second part of this book addresses practical techniques to solve real, everyday problems, including: \* Nondestructive testing \* Computer-Aided Design (CAD) \* TRIZ (the Russian acronym for Theory of Inventive Problem Solving) \* The Standard for the Exchange of Product Model Data (STEP) \* Virtual reality

Most books treat the subject of intermediate or advanced dynamics from an "analytical" point of view; that is, they

focus on the techniques for analyzing the problems presented. This book will present the basic theory by showing how it is used in real-world situations. It will not use software as a black box solution, nor drill the students in problem solving. It will present advanced concepts but in a new way - for example, detailed derivations of Lagrange's equations will be left to references or advanced courses but their utility as an...
