The Endocrine System | Hormone Health Network

The hormonal system (called the endocrine system in medical terminology) has various glands that release different hormones. It's the way in which one part of the body (the gland) tells another part of the body (the target cell) to do something important. The endocrine glands influence reproduction, metabolism, growth and many other functions.

Endocrine Disorders: Types, Causes, Symptoms, and Treatments

Endocrine glands are ductless glands of the endocrine system that secrete their products, hormones, directly into the blood. The major glands of the endocrine system include the pineal gland, pituitary gland, pancreas, ovaries, testes, thyroid gland, parathyroid gland, hypothalamus and adrenal glands. The hypothalamus and pituitary glands are neuroendocrine organs.

Endocrine gland - Wikipedia

The glands of the endocrine system send out hormones that tell each part of your body what work to do, when to do it, and for how long.

Download Ebook Hormones And The Endocrine System Review Answers

Hormones are vital to your health and well-being. Hormones are your body's chemical messengers. They travel in your bloodstream to tissues or organs to help them do their work.

Your Health and Hormones | Hormone Health Network

The endocrine system is a tightly regulated system that keeps the hormones and their effects at just the right level. One way this is achieved is through "feedback loops". The release of hormones is regulated by other hormones, proteins or neuronal signals. The released hormone then has its effect on other organs.
