The hypothetico-deductive model or method is a proposed description of the scientific method. According to it, scientific inquiry proceeds by formulating a hypothesis in a form that can be falsifiable, using a test on observable data where the outcome is not yet known. A test outcome that could have and does run contrary to predictions of the hypothesis is taken as a falsification of the hypothesis. A test outcome that could have, but does

## ~~Definition of Hypothetico~~

...

The method particularly associated with a philosophy of science that stresses the virtues of falsification. Most simply, a hypothesis is proposed, and consequences are deduced, which are then tested against experience. If the hypothesis is falsified, then we learn from the attempt, and are in a position to produce a better one.

The hypothetico-deductive method relies on the concept of falsification, an alternative to inductivism. The method is based on the works of Karl Popper. According to Popper, "Scientific theories are falsifiable.". The theory is stronger if the theory is falsifiable in principle. Falsificationists believe that theories should be submitted to rigorous testing such as experiment
