A concurrent program is the [UNINTELLIGIBLE PHRASE] because it's a collection of autonomous sequential threads executing logically in parallel. So you can execute this thing either multi-programming, so

we can multiplex different parts on multiprocessing. Well, multiprocessing basically has [UNINTELLIGIBLE] starting on different machines.

However, concurrent execution introduces many possibilities for bugs that were not present with linear execution. These bugs are easily avoided, and they must be addressed. Furthermore, the elimination of concurrency related bugs should not be an afterthought. Concurrency issues must be addressed from the beginning and considered always.

Concurrency. Large programs are often made up of many smaller sub-programs. For example a web server handles requests made from web browsers and serves up HTML web pages in response. Each request is handled like a small program. It would be ideal for programs like these to be able to run their smaller components at the same time (in the case of the web server to handle multiple requests).
