Socket programming in C++ is the way of combining or connecting two nodes with each other over a network so that they can communicate easily without losing any data. If we take a real-life example then the socket we see in reality is a medium to connect two devices or systems.

Socket programming is a way of connecting two nodes on a network to communicate with each other. One socket (node) listens on a particular port at an IP, while other socket reaches out to the other to form a connection. Server forms the listener socket while client reaches out to the server. Introduction To Sockets

To a programmer, a socket looks and behaves much like a low-level file descriptor. This is because commands such as `read ()` and `write ()` work with sockets in the same way they do with files and pipes. Sockets were first introduced in 2.1BSD and subsequently refined into their current form with 4.2BSD.

What is a Socket? - Tutorialspoint
Background # Sockets have a long history. Their use originated with ARPANET in 1971 and later became an API in the Berkeley Software Distribution (BSD) operating system released in 1983 called Berkeley sockets. When the Internet took off in the 1990s with the World Wide Web, so did network programming.

Let's now do some server tasks with sockets. Server Programming. OK now onto server things. Servers basically do the following : 1. Open a socket 2. Bind to a address(and port). 3. Listen for incoming connections. 4. Accept connections 5. Read/Send. Bind a socket. `socket_bind` can be used to bind a socket to a particular address and port. It needs a `sockaddr_in` structure similar to `connect` function.
