Chelation ion chromatography (CIC) is the name given to a mode of IC where the stationary phase used is one that not only interacts with the solute ions through a simple ion-exchange mechanism but has the potential to form coordinate bonds based on multipoint interactions (chelate formation) with the solute ions, typically inorganic cations.

Ion chromatography, a form of liquid chromatography, measures concentrations of ionic species by separating them based on their interaction with a resin. Ionic species separate differently depending on species type and size. Sample solutions pass through a pressurized chromatographic column where ions are absorbed by column constituents.
