Updated December 03, 2018. There is a solenoid in your GM converter that causes the the torque convertor clutch (TCC) to engage and disengage. When the TCC solenoid receives a signal from the engine control module (ECM), it opens a passage in the valve body and hydraulic fluid applies the TCC. When the ECM signal stops, the solenoid closes the valve and pressure is vented, causing the TCC to disengage.

TCC Solenoid and GM Converter Lock-up Problems

The torque convertor clutch solenoid shares a power source with the shift solenoids and is grounded by the PCM. You could try unpinning the TCC solenoid signal wire from the transmission connector to disable the solenoid. I'd avoid cutting into the harness if you can. Either way it'll set codes for circuit and performance if you do either of these.
