The measurement of materials properties is often referred to as materials characterization; thus nondestructive techniques applied to characterization become nondestructive characterization (NDCI). There are a number of meetings, proceedings and journals focused upon nondestructive technologies and the detection and identification of cracks and voids.

Examples have been given where nondestructive characterization has been capable of detecting alterations in structures prior to macroscopic defect detection. Moreover, it has been shown that nondestructive characterization affords a most promising opportunity for process control during production of materials, devices, and structures.
