In mathematics and physics, a nonlinear partial differential equation is a partial differential equation with nonlinear terms. They describe many different physical systems, ranging from gravitation to fluid dynamics, and have been used in mathematics to solve problems such as the Poincaré conjecture and the Calabi conjecture. They are difficult to study: there are almost no general techniques that work for all such equations, and usually each individual equation has to be studied as a separate

Nonlinear Partial Differential Equations with Applications ...

A non-linear partial differential equation together with a boundary condition (or conditions) gives rise to a non-linear problem, which must be considered in an appropriate function space. The choice of this space of solutions is determined by the structure of both the non-linear differential operator \mathcal{F} in the domain and that of the boundary operators.

Applying the ansatz $u(x,t)=u(\xi)$, $\xi=x-c t$ (where c is the wave velocity), it is possible to transform the PDE (u_x, t) into an ODE (u, ξ) , which can be solved by appropriate methods. In other words, a traveling wave solution of a given nonlinear PDE is a solution of the reduction $u''=x-c t$ (see Definition 2.8) if it exists.

In the search of the traveling wave solutions to nonlinear partial differential equation of the form the first step consists in considering the wave transformation Usually, $(x, t) \rightarrow (\xi, \tau)$ (the identity function). Using (2.2), (2.1) converts to an ordinary differential equation (ODE) with respect to ξ (shortly, w.r.t.) the function

Linear Partial Differential Equation. If the dependent variable and all its partial derivatives occur linearly in any PDE then such an equation is called linear PDE otherwise a nonlinear PDE. In the above example (1) and (2) are said to be linear equations whereas example (3) and (4) are said to be non-linear equations. [Quasi-Linear Partial Differential Equation](#)

Continuous group theory, Lie algebras and differential geometry are used to understand the structure of linear and nonlinear partial differential equations for generating integrable equations, to find its Lax pairs, recursion operators, Bäcklund transform and finally finding exact analytic solutions to the PDE.

Partial differential equation - Wikipedia

Equations that contain nonlinear terms are known as non-linear differential equations. All above are nonlinear differential equations. Nonlinear differential equations are difficult to solve, therefore, close study is required to obtain a correct solution. In case of partial differential equations, most of the equations have no general solution.

Partial Differential Equations with Nonlinear Coefficients. Some PDE coefficients may, in addition to space and time, also depend on the dependent variable and the first derivatives. Here x, y, z indicates the spatial variables, t is time. If a coefficient depends on the dependent variable, the equation is nonlinear. Consider the nonlinear equation:
