blocks called nucleotides. Each nucleotide consists of a nitrogen-containing aromatic base attached to a pentose (five-carbon) sugar, which is in turn attached to a phosphate group.

nucleic acid | Definition, Function, Structure, & Types ...

Nucleic acids are macromolecules that store genetic information and enable protein production. Nucleic acids include DNA and RNA. These molecules are composed of long strands of nucleotides. Nucleotides are composed of a nitrogenous base, a five-carbon sugar, and a phosphate group.

The nucleic acids are vital biopolymers found in all living things, where they function to encode, transfer, and express genes. These large molecules are called nucleic acids because they were first identified inside the nucleus of cells , however, they are also found in mitochondria and chloroplasts as well as bacteria and viruses.

Nucleic Acids - Structure and Function

Nucleic Acid Structure of DNA. The structure of DNA, a globally recognized double-helix, is based upon the two strands of a sugar-phosphate backbone held together by nitrogenous base spindles. DNA contains four nitrogenous bases, or nucleobases: adenine, thymine, cytosine, and guanine.

Physico-Chemical Properties of Nucleic Acids

The secondary structure is responsible for the shape that the nucleic acid assumes. The bases in the DNA are classified as purines and pyrimidines. The purines are adenine and guanine. Purines consist of a double ring structure, a six-membered and a five-membered ring containing nitrogen. The pyrimidines are cytosine and thymine. It has a single ring structure, a six-membered ring containing nitrogen.
