Oil Well Drilling Mud

Drilling mud, also called drilling fluid, in petroleum engineering, a heavy, viscous fluid mixture that is used in oil and gas drilling operations to carry rock cuttings to the surface and also to lubricate and cool the drill bit. The drilling mud, by hydrostatic pressure, also helps prevent the collapse of unstable strata into the borehole and the intrusion of water from water-bearing strata that may be encountered.

Drilling mud is basically a liquid drilling fluid that is used to facilitate the easy drilling of wellbores in the earth. It is often used to drill oil or gas wells and even for exploration drillings of wellbores. Drilling mud is usually of three types, i.e., water-based mud, oil-based mud and gaseous drilling mud. This mud is ideally used with force to create hydrostatic pressure during drilling procedure.

In geotechnical engineering, drilling fluid, also called drilling mud, is used to aid the drilling of boreholes into the earth. Often used while drilling oil and natural gas wells and on exploration drilling rigs, drilling fluids are also used for much simpler boreholes, such as water wells. One of the functions of drilling mud is to carry cuttings out of the hole. The three main categories of drilling fluids are: water-based muds, which can be dispersed and non-dispersed; non-aqueous muds, usua

Oil-based drilling muds may be used in deepwater wellwork. Oil-based drilling muds contain n-paraffins such as C 14, C 16 and C 18. Oil samples contaminated with large amounts of drilling mud may be inappropriate for PVT analysis of oil thermodynamic properties such as bubble point, density or gas oil ratio.

Oil-based mud - Wikipedia

Drilling mud is a circulating fluid used to bring cuttings out of the well bore, to cool the drill bit, and to provide hole stability and pressure control. Drilling mud is a substance which helps the drilling operation by cooling, lubricating, and cleaning the bit, reducing friction, and transporting cuttings from bit to the surface.

Rotary drilling uses fluids (drilling mud) to circulate out the rock as it is chipped away. The fluid washes out the drill hole as it goes, making the process more efficient. By applying downward pressure, drilling mud also stops an oil well from bursting forth unexpectedly – the dangerous and wasteful gushers.
