A fuzzy set operation is an operation on fuzzy sets. These operations are generalization of crisp set operations. There is more than one possible generalization. The most widely used operations are called standard fuzzy set operations. There are three operations: fuzzy complements, fuzzy intersections, and fuzzy unions

Fuzzy set operations - Wikipedia
Fuzzy Logic System Operation. Fuzzy operation involves use of fuzzy sets and membership functions. Each fuzzy set is a representation of a linguistic variable that defines the possible state of output. Membership function is the function of a generic value in a fuzzy set, such that both the generic value and the fuzzy set belong to a universal set. The degrees of membership of that generic value in the fuzzy set determines the output, based on the principle of IF-THEN.

Operations on Fuzzy Sets (Logical) Let A be a fuzzy interval between 5 and 8 and B be a fuzzy number about 4. The corresponding figures are shown below. The following figure shows the fuzzy set between 5 and 8 AND about 4 (notice the blue line). The Fuzzy set between 5 and 8 OR about 4 is shown in the next figure (again, it is the blue line). This figure gives an example for a negation.

Operations on Fuzzy Sets (Logical)
A fuzzy set A ~ in the universe of information U can be defined as a set of ordered pairs and it can be represented mathematically as $\mu_A \sim = \{ (y, \mu_A \sim (y)) | y \in U \}$ Here $\mu_A \sim (y)$ = degree of membership of y in $\mu_A \sim$ (A), assumes values in the range from 0 to 1, i.e., $\mu_A \sim (y) \in [0, 1]$.

Among the basic operations which can be performed on fuzzy sets are the operations of union, intersection, complement, algebraic product and algebraic sum.

Fuzzy sets and their operations - ScienceDirect
A fuzzy set A~ in the universe of discourse, U, can be defined as a set of ordered pairs and it is given by When the universe of discourse, U, is discrete and finite, fuzzy set A~ is given by where $\mu_A \sim$ is a finite value. Fuzzy sets also satisfy every property of classical sets.

Fuzzy logic is largely used to define the weights, from fuzzy sets, in neural networks. When crisp values are not possible to apply, then fuzzy values are used. We have already studied that training and learning help neural networks perform better in unexpected situations.

Your difference of fuzzy sets is correct, with the caveat that you should be calling it the "set difference" and be using the set difference operator as the arithmetic difference has a definition in line with the actual multiplication definition I described earlier, and in fact this arithmetic difference isn't actually defined in situations where the universe of discourse is limited to ...

In fuzzy mathematics, fuzzy logic is a form of many-valued logic in which the truth values of variables may be any real number between 0 and 1 both inclusive. It is employed to handle the concept of partial truth, where the truth value may range between completely true and completely false. By contrast, in Boolean logic, the truth values of variables may only be the integer values 0 or 1.

Fuzzy logic can be implemented in systems with different sizes and capabilities. For implementation, there should be a range of micro to macro controllers. Moreover, it can also be implemented in hardware or software or in a combination of both in Artificial Intelligence.

FUZZY OPERATORS. Basic operations As in classical logic, in fuzzy logic there are three basic operations on fuzzy sets: union, intersection and complement. Union: Let μ_A and μ_B be membership functions that define the fuzzy sets A and B, respectively, on the universe X. The union of fuzzy sets A and B is a fuzzy set defined by the membership ...

Fuzzy logic carries the more than one logical values and these values are the truth values of a variable or problem between 0 and 1. This idea was once introduced by way of Lotfi Zadeh in 1965 based on the Fuzzy Set Theory.; This notion provides the chances which are not given by computers, but similar to the range of chances generated by humans.

Definition Aggregation operations on fuzzy sets are operations by which several fuzzy sets are combined in a desirable way to produce a single fuzzy set. Aggregation operation on n fuzzy set ($2 \leq n$) is defined by a function h: $[0,1]^n \rightarrow [0,1]$ 19. Axioms for aggregation operations fuzzy sets Axiom h1.

The most important thing to realize about fuzzy logical reasoning is the fact that it is a superset of standard Boolean logic. In other words, if you keep the fuzzy values at their extremes of 1 (completely true), and 0 (completely false), standard logical operations will hold. As an example, consider the following standard truth tables.
